1. INTRODUCTION

1.1 Overview

The purpose of the Cospas-Sarsat System is to provide distress alert and location data for the support of search and rescue (SAR) and other emergency services using spacecraft and ground facilities to detect and locate distress signals.

Distress beacons transmit 406 MHz signals that are relayed through SAR instruments on Cospas-Sarsat low-altitude polar-orbit (LEOSAR) spacecraft, medium-altitude Earth orbit (MEOSAR) GNSS spacecraft, or geostationary (GEOSAR) spacecraft. These signals are relayed to Cospas-Sarsat ground facilities termed Local User Terminals (LUTs), which process the signals to determine the beacon location. Alerts are then relayed, together with location data, via a Mission Control Centre (MCC), either to another MCC or to the Distress authorities responsible for managing the response to the beacon alerts.

Each MCC distributes Cospas-Sarsat messages according to the System document C/S A.001, “Cospas-Sarsat Data Distribution Plan”, which defines the Cospas-Sarsat ground communication network. Most Cospas-Sarsat messages are sent in formats which permit the data to be automatically processed and transmitted. These message formats are described in this document C/S A.002, “Cospas-Sarsat Mission Control Centres Standard Interface Description”.

1.2 Document Objective

The Cospas-Sarsat System is operated in accordance with the 1988 International Cospas-Sarsat Programme Agreement (document C/S P.001) and other related documents. The purpose of this document C/S A.002 (SID) is to describe the message formats and communication standards that are used to transmit data between Cospas-Sarsat MCCs. It is designed to facilitate information exchange between Cospas-Sarsat MCCs and between those MCCs and Distress authorities.

This document specifies the structure and content of the information portion of Cospas-Sarsat messages, regardless of the communication network to be used. For an operational implementation, the information portion will of necessity be framed with the addressing, header and trailer data required by the specific network protocol.

1.3 Required Implementation Data

The following information must be agreed upon between two agencies establishing a communications interface:

- network and protocols to be used,
- data rate,
- addressing/routing,

- packet size constraints,
- security (e.g., password, call identification and caller user data).

Other information that is used in this document is contained on the Cospas-Sarsat website, available at <http://www.cospas-sarsat.int/en/pro>.

The acronyms used in this document are contained in the Cospas-Sarsat Glossary, document C/S S.011.

2. COMMUNICATION CHANNEL INTERFACES

Two types of communications are required among the Cospas-Sarsat MCCs. Voice communication is required for general coordination and follow-up/confirmation of certain automated message transmissions. Data communication using formatted messages are required for the transfer of Cospas-Sarsat alert data and System information.

2.1 Voice Communication Facilities

Voice communications are made over the public dial-up telephone network or other available facilities. Voice communication will not be discussed further in this document.

2.2 Data Communication Facilities

Except when otherwise noted, the following specifications (including Annexes) apply to all data communication involving Cospas-Sarsat Ground segment equipment (i.e., LUTs and MCCs) and external message destinations, including:

- a) messages sent by an MCC to another MCC;
- b) messages sent by an MCC to a foreign SPOC; and
- c) TOA/FOA (network) data sent by a MEOLUT to a MEOLUT associated with a different MCC.

These specifications do not apply to messages exchanged within an administration, e.g., alert messages sent by a LUT to its associated MCC, alert messages sent by an MCC to an RCC within the administration, or TOA/FOA data exchanged by LUTs controlled by a single administration.

All text and data transmissions to external destinations, including alert messages and System information messages, shall be made in character text format only and sent in accordance with Table 4-3. Each respective Ground Segment Provider shall:

- a) make the necessary provisions for connecting to the appropriate communication networks; and
- b) implement communications to external destinations, on the selected communication networks in accordance with the standards described in the annexes to this document.

Ground Segment Providers may bilaterally choose to implement primary and alternate communications systems.

2.2.1 Subject Indicator Types (SITs)

Annex A lists messages sent by MCCs, where each type of message is identified by a Subject Indicator Type (SIT). The SIT is used to facilitate automatic message handling. Annex A lists the

SIT code numbers and their assigned use. Annex C defines the content of each of the SIT messages.

2.2.2 Cospas-Sarsat Message Text

All Cospas-Sarsat messages contain specified types of information. Each one of these information types, called a Message Field (MF), is described in greater detail in Annex B. These message fields are then grouped as shown in Annex C to produce the messages for the various SITs listed in Annex A.

Fields indicated by the letter "A" and letter "X" shall not be omitted. Originators of operational messages shall provide actual values in all fields indicated by the letter "A" in Tables C-1 and C-2, as available. Fields indicated by the letter "X" may use default values if actual data is not available.

Originators of SIT 185 messages destined to RCCs and SPOCs shall populate all the fields indicated by the letter "M" in Table C-3. Fields indicated by the letter "O" in Table C-3 may be omitted if their value is NIL in order to minimize the overall length of the SIT 185 message.

2.2.3 Character Text

This specification is based on a text format using International Alphabet No.5 representation. To provide for use on networks using the International Telegraph Alphabet No.2 (ITA2) characters, a table of equivalence between the International Alphabet No.5 character representation and ITA2 is provided in Table 4-3.

– END OF SECTION 2 –

3. COMMUNICATION STANDARDS

The message formats presented in this document provide flexibility, efficiency, and compatibility among MCCs. They are independent of the communication network and protocol employed.

All MCC messages are formed as a series of octets (one octet is 8 bits, or one byte, which contains one character and is commonly referred to as a “character”). A message may be made up of any number of octets, subject to the restriction in section 4.

The communication networks accepted for communications with destinations are introduced below and the standards to which each MCC must adhere for their use in the Cospas-Sarsat Ground Segment are described in the annexes to this document. Some of these networks provide an error detection and/or error correction capability for detecting and correcting data errors introduced by the communications system, in order to prevent corrupt messages from being transmitted.

Ground Segment Providers shall implement adequate security to protect their automated means of communications, including MCCs firewall technology to protect each of their Internet connections.

3.1 File Transfer Protocol (FTP) Communications

FTP is an Internet-based protocol that can be used to exchange messages. It is highly reliable due to its inherent error detection and correction capability. Communicating via FTP shall comply with the applicable standards described in the Internet Engineering Task Group document RFC 959 - File Transfer Protocol and the Cospas-Sarsat standards contained in Annex F.

All FTP servers used for the exchange of SIT messages should be linked exclusively using Internet virtual private networks (VPNs) that meet the Cospas-Sarsat standard provided at Annex G. This is referred to as FTPV communication.

3.2 AFTN/AMHS Communications

The Aeronautical Fixed Telecommunications Network (AFTN) is a worldwide system that provides point-to-point communications for text messages. Access to the AFTN network is restricted to terminals that are operated in controlled locations, such as Air Traffic Control Centres and MCCs. This network may operate at fairly low data rates (i.e., 300 or 9600 baud). Communications procedures for the AFTN are controlled by ICAO and are detailed in Annex 10 to the Convention on International Civil Aviation, Volume II, Communication Procedures. Guidance for using AFTN is provided at Annex H to this document.

AFTN is being upgraded by ICAO to the Aeronautical Message Handling System (AMHS). The transition from AFTN to AMHS will be implemented gradually to meet the requirements of Administrations. This transition is expected to enhance communication services in several regions of the world and should not negatively impact the use of AFTN communications by Cospas-Sarsat.

3.3 Email Communications

Electronic mail is a store-and-forward communication method over the Internet or other networks. It is an optional mode of communications between MCCs and destinations which may be undertaken on a bilateral contingency basis. Guidance on using email is provided at Annex I to this document.

3.4 Web Service Communications

Nodal MCCs shall provide ELT(DT) alert data to the Location of an Aircraft in Distress Repository (LADR) using Web Services, per Annex C, section “MESSAGE CONTENT FOR MESSAGES SENT TO THE LADR”. The use of Web Services shall comply with SWIM T1-Yellow Profile binding requirements, per Appendix 3 of the LADR Functional Specifications (draft version 3.1).

– END OF SECTION 3 –

This document has been superseded by a later version

4. MESSAGE FORMAT

4.1 Format Requirements

All Cospas-Sarsat messages shall be framed as shown in Figure 4.1. The structure of the frames is specified by the host network and does not impact the Cospas-Sarsat information transmitted.

For the entire message, including the required network framing, the number of characters on any one line shall not exceed 69. This does not include the New Line (NL) sequence described below.

Each line shall end with a new line (NL) sequence that is defined as CRCRLF or CRLF where:

CR means Carriage Return - Hex 0D (i.e., zero D)

LF means Line Feed - Hex 0A (i.e., zero A)

The entire message, including any network required framing, shall not exceed 25,000 characters.

However, message originators may need to further limit message size depending on specific network constraints.

Format Frame	Contents
HEADER (network dependent)	Made available to satisfy the host network requirements (if any). These contents must be designed into the application software of the agency using the network.
INFORMATION (SIT message)	Cospas-Sarsat message text as defined in this document, irrespective of the network in use.
TRAILER (network dependent)	As per HEADER above.

Figure 4.1: General Message Structure

Since some communication networks may add a header that precedes the SIT message, MCCs must be able to identify the beginning of a SIT message. The presence of SIT Message Fields 1 - 3 shall be used to identify the beginning of the SIT message text. That is, Message Fields 1 - 3 shall have the format “/nnnnn nnnnn/nnnn/nnn nn nnnn”, where n is a numeral between 0 - 9.

4.2 Character Set

The set of International Alphabet No.5 characters that have an equivalent ITA2 character is the set of allowable characters for the INFORMATION frame of Figure 4.1.

To ensure compatibility, Tables 4-1, 4-2 and 4-3 provide details of those characters. Table 4-1 defines the International Alphabet No.5 characters while Table 4-2 illustrates ITA2 characters. Table 4-3 details the conversions between the two character sets.

Characters not found in Table 4-3 are not permitted.

The octothorpe (#) character shall not be used in the information frame of Cospas-Sarsat messages as it is a command character for some networks.

The “@” (AT sign), “%” (percentage sign), and “_” (underscore sign) are not listed in Table 4-3, but are required for some messages.

The “@” (AT sign) should be replaced by “(AT)”, the “%” (percentage sign) should be replaced by “PERCENT”, and the “_” (underscore sign) should be replaced by “(UNDERSCORE)”.

For consistency, this format should apply to all messages that are sent by MCCs through all communication modes

ANNEX A**SUBJECT INDICATOR TYPES (SITs)****1. GENERAL**

All Cospas-Sarsat messages are identified by a Subject Indicator Type (SIT) number according to the subject matter being transmitted.

Descriptions of the Subject Indicator Types are included in Tables A-1 and A-2.

2. SIT BLOCK ASSIGNMENT

To maintain uniqueness between the SIT numbers for all Cospas-Sarsat agencies, Table A-3 subdivides the range of possible numbers, from 000 to 999 by subject and application.

The proper application of this table will ensure standardization in numbers and usage to facilitate automatic message handling by the MCCs.

This document has been
superseded by a later version

Table A-1:
Subject Indicator Types for Alert Messages

SIT	Title	Meaning	Page
FGB LEOSAR and GEOSAR Incident Alert Messages			
121	DOPPLER INTERFERER NOTIFICATION (FGB)	These messages are used for notification of 406 MHz interferer signals from a LEOLUT.	C-20
122	LEOSAR/GEOSAR INCIDENT (NO DOPPLER) (FGB)	406 MHz alert message from an FGB with no Doppler positions. An encoded (i.e., GNSS) position may or may not be available.	C-21
123	POSITION CONFLICT (LEOSAR/GEOSAR; ENCODED ONLY) (FGB)	406 MHz alert message from an FGB with no Doppler positions for which the encoded (i.e., GNSS) position differs by more than the match criteria from one or more previous positions.	C-21
124	POSITION CONFIRMATION (LEOSAR; ENCODED ONLY) (FGB)	406 MHz alert message from an FGB with no Doppler positions that identifies the confirmed position of a 406 MHz alert.	C-21
125	INCIDENT (LEOSAR) (FGB)	Beacon alert message computed using 406 MHz incident data from an FGB. The message contains Doppler positions.	C-22
126	POSITION CONFLICT (LEOSAR) (FGB)	Beacon alert message computed using 406 MHz incident data from an FGB. The message contains Doppler and/or encoded (i.e., GNSS) position(s) which may differ from previous position(s) by the match criteria.	C-22
127	POSITION CONFIRMATION (LEOSAR) (FGB)	406 MHz alert message from an FGB with Doppler positions that identifies the confirmed position of a 406 MHz alert. It may or may not contain an encoded (i.e., GNSS) position.	C-22
132	NOTIFICATION OF COUNTRY OF REGISTRATION (LEOSAR/GEOSAR ENCODED ONLY) (FGB)	Message used between MCCs to notify the country of registration of an FGB 406 MHz beacon (NOCR). This message does not contain independent position data (Doppler position data). It may or may not contain an encoded (i.e., GNSS) position.	C-21
133	NOTIFICATION OF COUNTRY OF REGISTRATION (LEOSAR) (FGB)	Message used between MCCs to notify the country of registration of an FGB 406 MHz beacon (NOCR). This message contains Doppler position data. It may or may not contain an encoded (i.e., GNSS) position.	C-22
134	NOTIFICATION OF RETURN LINK SERVICE PROVIDER (LEOSAR/GEOSAR; ENCODED ONLY) (FGB)	Message used between MCCs to notify the responsible MCC (see note 1) of an FGB 406 MHz beacon with RLS capability. This message only contains an encoded (i.e., GNSS) position (i.e., it does not contain Doppler positions). This message may or may not contain an encoded (i.e., GNSS) position when an updated alert is sent to the RLSP after position confirmation.	C-21
135	NOTIFICATION OF RETURN LINK SERVICE PROVIDER (LEOSAR/GEOSAR) (FGB)	Message used between MCCs to notify the responsible MCC (see note 1) of an FGB 406 MHz beacon with RLS capability. This message contains Doppler position data. It may or may not contain an encoded (i.e., GNSS) position.	C-22

SIT	Title	Meaning	Page
FGB MEOSAR Incident Alert Messages			
136	NOTIFICATION OF COUNTRY OF REGISTRATION (MEOSAR; ENCODED ONLY) (FGB)	Message used between MCCs to notify the country of registration of an FGB 406 MHz beacon (NOCR). This message does not contain independent position data (DOA position data). It contains an encoded (i.e., GNSS) position.	C-24
137	NOTIFICATION OF COUNTRY OF REGISTRATION (MEOSAR) (FGB)	Message used between MCCs to notify the country of registration of an FGB 406 MHz beacon (NOCR). This message contains DOA position data. It may or may not contain an encoded (i.e., GNSS) position.	C-23
138	NOTIFICATION OF RETURN LINK SERVICE PROVIDER (MEOSAR; ENCODED ONLY) (FGB)	Message used between MCCs to notify the responsible MCC (see note 1) of an FGB 406 MHz beacon with RLS capability. This message only contains an encoded (i.e., GNSS) position (i.e., it does not contain a DOA position). This message may or may not contain encoded (i.e., GNSS) position when an updated alert is sent to the RLSP after position confirmation.	C-24
139	NOTIFICATION OF RETURN LINK SERVICE PROVIDER (MEOSAR) (FGB)	Message used between MCCs to notify the responsible MCC (see note 1) of an FGB 406 MHz beacon with RLS capability. This message contains DOA position data. It may or may not contain an encoded (i.e., GNSS) position.	C-23
141	DOA INTERFERER NOTIFICATION (FGB)	These messages are used for notification of 406 MHz interferer signals from a MEOLUT.	C-23
142	MEOSAR INCIDENT (NO DOA) (FGB)	406 MHz alert message from an FGB with no DOA position. An encoded (i.e., GNSS) position may or may not be available.	C-24
143	POSITION CONFLICT (MEOSAR; ENCODED ONLY) (FGB)	406 MHz alert message from an FGB with no DOA position for which the encoded (i.e., GNSS) position differs by more than the match criteria from one or more previous positions.	C-24
144	POSITION CONFIRMATION (MEOSAR; ENCODED ONLY) (FGB)	406 MHz alert message from an FGB with no DOA position that identifies the confirmed position of a 406 MHz alert.	C-24
145	INCIDENT (MEOSAR) (FGB)	Beacon alert message computed using 406 MHz incident data from an FGB. The message contains a DOA position.	C-23
146	POSITION CONFLICT (MEOSAR) (FGB)	Beacon alert message computed using 406 MHz incident data from an FGB. The message contains DOA and/or encoded (i.e., GNSS) position(s) which may differ from previous position(s) by the match criteria.	C-23
147	POSITION CONFIRMATION (MEOSAR) (FGB)	406 MHz alert message from an FGB with a DOA position that identifies the confirmed position of a 406 MHz alert. It may or may not contain an encoded (i.e., GNSS) position.	C-23
185	COSPAS-SARSAT ALERTS (FGB & SGB)	Message used for alert and NOCR messages from MCCs to SPOCs (FGBs and SGBs).	C-29 to C-46

SIT	Title	Meaning	Page
SGB Incident Alert Messages			
322	GEOSAR INCIDENT (SGB)	406 MHz alert message from an SGB, which does not contain independent position data (Doppler or DOA position data). It may or may not contain an encoded (i.e., GNSS) position.	C-25
323	POSITION CONFLICT (GEOSAR; ENCODED ONLY) (SGB)	406 MHz alert message from an SGB with no Doppler nor DOA positions for which the encoded (i.e., GNSS) position differs by more than the match criteria from one or more previous positions.	C-25
324	POSITION CONFIRMATION (GEOSAR; ENCODED ONLY) (SGB)	406 MHz alert message from an SGB with no Doppler nor DOA positions that identifies the confirmed position of a 406 MHz alert.	C-25
332	NOTIFICATION OF COUNTRY OF REGISTRATION (GEOSAR ENCODED ONLY) (SGB)	Message used between MCCs to notify the country of registration of an SGB 406 MHz beacon (NOCR). This message contains only an encoded (i.e., GNSS) position.	C-25
334	NOTIFICATION OF RETURN LINK SERVICE PROVIDER (GEOSAR; ENCODED ONLY) (SGB)	Message used between MCCs to notify the responsible MCC (see note 1) of an SGB 406 MHz beacon with RLS capability. This message only contains an encoded (i.e., GNSS) position (i.e., it contains no independent position). This message may or may not contain encoded (i.e., GNSS) position when an updated alert is sent to the RLSP after position confirmation.	C-25
336	NOTIFICATION OF COUNTRY OF REGISTRATION (MEOSAR ENCODED ONLY) (SGB)	Message used between MCCs to notify the country of registration of an SGB 406 MHz beacon (NOCR). This message does not contain independent position data (DOA position data). It contains an encoded (i.e., GNSS) position.	C-27
337	NOTIFICATION OF COUNTRY OF REGISTRATION (MEOSAR) (SGB)	Message used between MCCs to notify the country of registration of an SGB 406 MHz beacon (NOCR). This message contains DOA position data. It may or may not contain an encoded (i.e., GNSS) position.	C-26
338	NOTIFICATION OF RETURN LINK SERVICE PROVIDER (MEOSAR; ENCODED ONLY) (SGB)	Message used between MCCs to notify the responsible MCC (see note 1) of an SGB 406 MHz beacon with RLS capability. This message only contains an encoded (i.e., GNSS) position (i.e., it contains no independent position). This message may or may not contain encoded (i.e., GNSS) position when an updated alert is sent to the RLSP after position confirmation.	C-27
339	NOTIFICATION OF RETURN LINK SERVICE PROVIDER (MEOSAR) (SGB)	Message used between MCCs to notify the responsible MCC (see note 1) of an SGB 406 MHz beacon with RLS capability. This message contains DOA position data. It may or may not contain an encoded (i.e., GNSS) position.	C-26
342	MEOSAR INCIDENT (NO DOA) (SGB)	406 MHz alert message from an SGB with no DOA position. An encoded (i.e., GNSS) position may or may not be available.	C-27
343	POSITION CONFLICT (MEOSAR; ENCODED ONLY) (SGB)	406 MHz alert message from an SGB with no DOA position for which the encoded (i.e., GNSS) position differs by more than the match criteria from one or more previous positions.	C-27

SIT	Title	Meaning	Page
344	POSITION CONFIRMATION (MEOSAR; ENCODED ONLY) (SGB)	406 MHz alert message from an SGB with no DOA position that identifies the confirmed position of a 406 MHz alert.	C-27
345	INCIDENT (MEOSAR) (SGB)	Beacon alert message computed using 406 MHz incident data from an SGB. The message contains a DOA position.	C-26
346	POSITION CONFLICT (MEOSAR) (SGB)	Beacon alert message computed using 406 MHz incident data from an SGB. The message contains a DOA position and possibly an encoded (i.e., GNSS) position which may differ from previous position(s) by the match criteria.	C-26
347	POSITION CONFIRMATION (MEOSAR) (SGB)	406 MHz alert message from an SGB with a DOA position that identifies the confirmed position of a 406 MHz alert. It may or may not contain an encoded (i.e., GNSS) position.	C-26

Note 1: The responsible MCC for the various GNSS providers is stated in the Table “Associated MCCs for Return Link Service Providers” in document C/S A.001; e.g., for the Galileo system it is the FMCC.

Table A-2:
Subject Indicator Types for System Information and Narrative Messages

SIT	Title	Meaning	Page
System Messages			
215	ORBIT VECTORS	Sarsat or Cospas spacecraft orbit position and time message.	C-47
216	ORBIT VECTORS	Sarsat or Cospas spacecraft orbit position and time message. Used in special conditions (e.g., after a satellite manoeuvre) when it is required that orbit vectors at the MCC and its associated LUTs be initialized. See document C/S A.001, section entitled “Scheduled Satellite Manoeuvres”.	C-47
217	ORBIT VECTORS	MEOSAR spacecraft two-line orbital elements (TLE) message.	C-48
415	SARP CALIBRATION	Time and frequency calibration for a SARP.	C-49
417	SARP-3 CALIBRATION	Time and frequency calibration for a SARP-3.	C-51
510	406 MHz SARR FREQUENCY CALIBRATION OFFSET	Offset between actual and 406 MHz SARR-provided beacon frequencies.	C-53
605	SYSTEM STATUS AND INTERNATIONAL EXERCISE NOTIFICATION TO ALL MCCs	Narrative message transmitted to all MCCs to indicate changes in System status and provide beacon test notification for Cospas-Sarsat approved international exercises (as specified in section “Co-Ordination of Beacon Tests” of document C/S A.001) . System status messages include System element and System function failures, scheduled maintenance, integration or testing of new System elements, and the commissioning of new equipment or new capabilities of existing equipment.	C-50 & C-54 to C-58
915	For MCC information transmission to a single MCC	Narrative message for MCC to MCC operator. This is a free format message, except when a specific format is defined (Note 1). Includes notification to affected MCCs about operational beacon tests under the control of a national administration, as specified in section “Co-Ordination of Beacon Tests” of document C/S A.001.	C-50
925	406 BEACON REGISTRATION INFORMATION (15 HEX ID)	This message is used between MCCs to provide 406 MHz beacon registration information (for 15 Hex ID).	C-59
926	406 BEACON REGISTRATION INFORMATION (23 HEX ID)	This message is used between MCCs to provide 406 MHz beacon registration information (for 23 Hex ID).	[TBD]
927	BEACON OPERATIONAL CHARACTERISTICS INFORMATION FOR MCCs	Narrative message transmitted to all MCCs to provide information on the operational characteristics for C/S Type Approved Second Generation Beacons (SGBs).	C-60
985	BEACON OPERATIONAL CHARACTERISTICS INFORMATION FOR SPOCs	Narrative message transmitted to Distress authorities (including SPOCs) and FGB-only capable MCCs to provide information on the operational characteristics for a C/S Type Approved Second Generation Beacon (SGBs).	C-61

SIT	Title	Meaning	Page
System Messages for Space Segment Providers			
416	SARP TELEMETRY	SARP telemetry from a Sarsat spacecraft.	C-50
425	SARP OUT OF LIMIT	Warning message to indicate abnormal performance of the SARP.	C-50
435	SARP COMMAND	Command request for the SARP.	C-52
445	SARP COMMAND VERIFICATION	Verification of the execution (or non-execution) of a SARP command as requested by command message.	C-50
515	SARR TELEMETRY	SARR telemetry from a Sarsat spacecraft.	C-50
525	SARR OUT OF LIMIT	Warning message to indicate abnormal performance of the SARR.	C-50
535	SARR COMMAND	Command request for the SARR.	C-52
545	SARR COMMAND VERIFICATION	Verification of the execution (or non-execution) of a SARR command as requested by a SARR command message.	C-50

Note 1: Free format applies only to the message text. The complete message must still be formatted as per the host communication networks procedures.

**Table A-3:
SIT Number Assignment**

Subject Matter	Between Cospas-Sarsat MCCs	Internally by each Cospas-Sarsat Participant	Between Cospas-Sarsat MCCs and non Cospas-Sarsat Agencies	Future Growth
				000 - 099
INCIDENTS (FGB)	100 - 149	150 - 179	180 - 199 ¹	
ORBIT	200 - 249	250 - 279	280 - 299	
INCIDENTS (SGB)	300 - 349	350 - 379	380 - 399 ¹

NARRATIVE	900 - 949	950 - 979	980 - 999	

Note: SIT for new messages other than those used internally by each Cospas-Sarsat participant shall be coordinated with all Cospas-Sarsat MCCs before being implemented.

1- SIT 185 messages shall be used with either FGB or SGB alerts.

– END OF ANNEX A –

ANNEX B

MESSAGE FIELD DESCRIPTION

1. GENERAL

Every Cospas-Sarsat SIT message is divided into a series of fields, each field containing unique information. Each Message Field (MF) is described in this Annex in terms of possible characters and range of numbers.

All fields must be present when required for a specific SIT message

Message formats and examples by SIT numbers are given in Annex C.

2. MESSAGE FIELD LIST

A detailed description of each Message Field is given in this Annex. Once it is known which MFs form a particular SIT, their corresponding formats are concatenated to form the information frame of the message.

The list in Table B-1 is composed of four columns:

- Message Field Number (MF #),
- Message Field Name (Name),
- Content,
- Character Text.

2.1 MF #

The numbers in this column are for simplicity of reference in Annex C.

2.2 Name

This column contains the name of the message field.

2.3 Content

This column contains the value ranges and meanings of the numbers of each MF.

The listed default values are inserted in the field only when the MCC has no proper value to insert.

2.4 Character Text

This column contains the format for each MF. Note that for MF #1 to MF #44, MF # 64 to #84 and MF #87 to #97, fields are separated by a "/" inserted at the beginning of the field, while the elements within a field are separated by a space (indicated as "b"). For all other message fields, all

required "/" and spaces (b) are indicated where they are needed. Where multiple spaces are indicated in a field in the SIT 185 message, the number of spaces may be reduced, if at least one space is provided.

The following legend applies:

- all upper case = the actual transmitted character,
- a = all transmittable characters,
- h = hexadecimal characters (0-9, A-F),
- s = sign symbol, plus (+) or minus (-),
- n = numerals 0 to 9,
- b = blank space character.

Ensure the 25,000-character transmission limit is not exceeded.

This document has been
superseded by a later version

Table B-1: Message Field Description

See details of message field description provided in Appendix B.1

MF #	NAME	CONTENT	CHARACTER TEXT
1	MESSAGE NUMBER	Current message Original message 00001 to 99999 If the outgoing message is not a retransmission, "00000" will be inserted as the original message number.	nnnnn nnnnn
2	REPORTING FACILITY	See (www.cospas-sarsat.int)	nnnn
3	MESSAGE TRANSMIT TIME	Year = 00 -> 99 Day Julian = 001-> 366 UTC - Hours= 00 -> 23 Minutes = 00 -> 59	nn nnn nnnn └─┘
4	SIT	(See Table A-1 and A.2) 000 to 999	nnn

APPENDIX B.1 TO ANNEX B**MESSAGE FIELD DEFINITION****MF Message Field Definition**

#

1. Message Number

If the outgoing message is a retransmission of a previous message, the current message number will be followed by the message number of the original message.

For message accountability, it is recommended that the outgoing message number be unique and sequential for each destination. See Appendix B.3 for a suggested algorithm for message sequence tracking.

2. Reporting Facility

The identification code corresponding to the Ground Segment Facility sending the current message.

3. Message Transmit Time

The time at which the current message is placed on the communication channel by the reporting agency.

4. SIT

The Subject Indicator Type corresponding to the format required for the message being sent.

5. Destination MCC

The identification code corresponding to the destination of the SIT message. For the SIT 915 and 925 messages this is the final destination of the SIT message, for all other SIT messages this is the MCC receiving the current message.

6. Spacecraft ID

The satellite identification to which the message data applies.

7. Orbit Number

The orbit number of the spacecraft designated in MF #6. If the number exceeds 99,999, then the last five (5) digits of the actual orbit number are provided; for example, orbit number 100,001 is provided as “00001”.

8. Number of Alerts with Doppler/DOA Positions

The number of alerts of this SIT format with Doppler or DOA positions, that are included between the SIT header and the SIT trailer as specified in Table C-1.

9. (Not Used - previously “Number of Images Reported”)

10. Number of Alerts without Doppler/DOA Positions

The number of alerts of this SIT format without Doppler or DOA positions, that are included between the SIT header and the SIT trailer as specified in Table C-1.

11. Source ID

The identification code corresponding to the MCC / LUT Ground Segment Facility that originally provided the solution data being reported on in the SIT message.

12. Local/Global Flag

Indicates if the reported Doppler location has been obtained from the local mode or from the global mode of operation. If the Doppler location is a mixture of global and real time data and the time of the first data point is before the AOS of the LUT, the flag is set as GLOBAL.

Processing Channel

The processing channel used to produce a solution. 406 SARP solutions only use data bursts processed through the SARP channel on-board the satellite. 406 SARR solutions only use data bursts relayed through the repeater on-board the satellite. 406 combined SARP and SARR are solutions where the data bursts or the solutions are combined at the LUT.

406 MHz combined LEO/GEO solutions contain Doppler locations that have been produced by LEO/GEO processing.

The value for this field shall be computed from the ‘A’ solution.

13. Bias

This value is an estimate of the frequency offset of the computed transmission frequency of the detected signal from the frequency of 406.025000 MHz.

The transmission frequency is calculated as part of the location processing in a LEOLUT and a MEOLUT. For GEOSAR alerts bias is given for the last detected burst.

BSDEV

The standard deviation of the bias measurement.

For GEOSAR alerts BSDEV is the absolute value of the difference between the first and last detected bursts.

A standard deviation of the bias measurement greater than 999 will be limited to 900.0.

Drift

The rate of frequency change of the beacon carrier frequency with time.

A drift rate greater than +/- 99.00 will be limited to +/- 99.00.

For GEOSAR alerts drift is the average frequency drift between the first and last detected burst (‘+’ if frequency increases verses time).

The value for this field shall be computed from the ‘A’ solution.

14. TCA

For LEOSAR Doppler location data, the Time of Closest Approach (TCA) indicates the time at which the satellite was closest to the beacon. For LEOSAR detect only solutions, the TCA is the time of the last data point. For LEOSAR alerts, the value for this field shall be computed from the 'A' solution.

For GEOSAR, the TCA field contains the time of the first beacon burst for the alert.

For MEOSAR, the TCA field contains the time associated with this solution, as computed by averaging the associated TOA measurements; the time of the first burst (field 14a) and the time of the last burst (field 14b) are provided separately.

15. Window Factor

The Window Factor is an indicator of the position of the data points relative to the TCA.

If the TCA is included in the set of data points, then the Window Factor is set to "0". If the TCA is not included in the set of data points, then the Window Factor has a range between "1" and "9". All values greater than "9" are set to "9".

For a LEOSAR solution the value for this field shall be computed from the 'A' solution.

16. Number of Iterations

The number of times the LUT computer had to process the detected incident data to arrive at the solution being reported on.

If the number of iterations is greater than 9, it shall be reported as a value of "9".

For a LEOSAR solution the value for this field shall be computed from the 'A' solution.

17. Cross Track Angle

The Cross Track Angle (CTA) is the angle at the centre of the earth, between the satellite and the beacon at TCA.

For a LEOSAR solution the value for this field shall be computed from the 'A' solution.

18. Secondary Source ID (previously: Power Indicator)

For 406-MHz combined LEO/GEO data, the identification code corresponding to the GEOLUT that originally provided the GEOSAR data for combined processing.

The default value for this field is "0000".

19. Number of Sidebands

The number of identified sideband components around the solution curve that have been removed (filtered out) by the LUT/MCC.

20. Sweep Period

For 406-MHz interferers, use the default value "0000".

(Previously the time taken by the amplitude modulation (AM) of the 121.5/243 MHz beacon signal to change from the higher to the lower AM frequency limit.)

SPSDEV

For 406-MHz interferers, use the default value “99”.

(Previously the Sweep Period Standard Deviation, defined as the measured standard deviation of the sweep period for the solution being reported, computed from the ‘A’ solution.)

21. Number of Points

For data originating from the LEOSAR system: The number of bursts detected by the LEOLUT for each 406 MHz beacon identification, used to develop a solution. For combined SARP and SARR, it is the number of unique time-frequency data points after the two processes have been merged.

For data originating from the GEOSAR system: The number of independent integrations performed to produce a 406 MHz beacon message as described in document C/S T.009. For unconfirmed messages, the number of points shall be set to “1”. For confirmed messages, the number of independent integrations shall be reported.

For combined LEO/GEO processing, it is the number of data points used from the LEOSAR channel in the combined processing.

For LEOSAR Doppler solutions, the value for this field shall be computed from the ‘A’ solution.

For data originating from the MEOSAR system: the number of bursts used to develop the DOA position or, when no DOA position is provided, the number of bursts associated with the alert.

The value for this field shall be set to “99” if the ‘Number of Points’ value exceeds 99.

22. Beacon ID

A 15 character hexadecimal representation of the beacon ID per the section titled “Beacon Identification” of document C/S A.001.

23. FGB Beacon Message

The 406 MHz FGB binary message of the solution, in its ‘undecoded’ form, shown in the full 30-hexadecimal character representation. Short format messages are left justified and zero-filled.

24. DDR/Service Area

The MCC country code for the individual MCC service area or the MCC country code of the nodal MCC for the DDR as provided on the Cospas-Sarsat website (www.cospas-sarsat.int).

Nodal MCCs shall fill this field with the individual service area.

Position Status Flag (PS Flag)

Indicates the position status as confirmed, image, non-image, unconfirmed or incorrect.

For position confirmation messages and messages after position confirmation, “+” indicates the confirmed position and “-” indicates an incorrect position. For position confirmation messages, a “-” in both the ‘A’ and ‘B’ Doppler solution, or in the DOA solution, indicates that the confirmed position is the GNSS (i.e., encoded) position contained in the Beacon Message.

For messages with Doppler position prior to position confirmation, a “+” in both the ‘A’ and ‘B’ solution indicates that no position is confirmed. If one (‘A’ or ‘B’) solution is set to “-” and the other solution is set to “+”, then a “-” indicates that this position is an image (incorrect) and a “+” indicates that this position is a non-image, as determined by the “406 MHz LEOSAR Image Position Determination” algorithm in Appendix B.2 to Annex B. Determining that a position is an image prior to position confirmation is optional.

For messages with DOA position prior to position confirmation, a “-” indicates that the position is unconfirmed.

25. Latitude

The calculated latitude of the solution.

26. Longitude

The calculated longitude of the solution.

27. Error Ellipse

An ellipse centred at latitude (MF #25) and longitude (MF #26) and containing the true location with a 50% probability.

Angle

The orientation to true north of the major axis of the error ellipse, in a clockwise direction.

Major Axis

The half length, in kilometres, of the major axis of the ellipse.

Any half length axis value greater than 999.9 kilometres will be limited to 999.9.

Minor Axis

The half length, in kilometres, of the minor axis of the ellipse.

Any half length axis value greater than 999.9 kilometres will be limited to 999.9.

28. Probability

The probability that the corresponding Doppler location reported in the SIT message is the actual location and not the image location.

29. Next Time of Visibility

The predicted time (predicted Loss of Signal - LOS) at which the next beacon event (in local mode) for the position being reported will occur. This time is provided by the originating

MCC or a nodal MCC (only if an earlier time is available at the node). The default value of zeros shall be used when the next time of visibility is not calculated.

30. Confidence Factor

An indication of the accuracy of the calculated solution based on a correlation between a variety of parameters. It may be calculated by the MCC based on the error estimate provided in the alert message.

Confidence Factor No.	Meaning
5	Within 1.0 nautical mile
4	Within 5.0 nautical miles
3	Within 20.0 nautical miles
2	Within 50.0 nautical miles
1	Less accurate than the above
9	Information not available

31. Data Residual

SDEV

The standard deviation of the actual data points to the solution Doppler curve.

A small number is desirable.

TREND

The standard deviation on the time shifted solution Doppler curve.

It is an indication of the curve dispersion and a number higher than SDEV is desirable.

32. Number of Orbit Vectors

The number of orbit vectors (MFs #34, #35 and #36) that are being transmitted in the SIT message.

33. Number of Procedure Names

The number of SARR or SARP commands that are being transmitted in the SIT message.

34. Orbit Time

The time at which the position (MF #35) and the velocity (MF #36) vectors of the satellite, are valid.

35. Orbit Position

The position of the satellite in relation to the centre of the earth in X, Y and Z co-ordinate, in effect at the time specified by MF #34.

36. Orbit Velocity

Velocity of the spacecraft relative to the earth-fixed co-ordinate system shown for MF #35, expressed in that same co-ordinate system.

37. Calibration Time

The time at which the Ultra-Stable Oscillator (USO) time reference on Sarsat was rolled over as per MF #38.

38. USO Frequency

The oscillator frequency that was measured at the time specified in MF #37.

38a. USO Frequency for SARP-3

The same as MF #38 above but with an additional integer to accommodate SARP-3 frequencies.

39. Command Procedure Name

The name of the commands to be executed at the time specified by MF #40 for both SARR and SARP command messages.

Priority

The indication of urgency for the execution of the spacecraft command procedure.

40. Execute Time

The time at which the command procedure name specified in MF #39 is to be executed.

41. Narrative Text

The character text to be transmitted as part of SIT message. Always terminated by 2 Carriage Returns, 1 Line Feed, 4 Qs, 2 Carriage Returns and 1 Line Feed. In SIT 605, 915 and 925 messages, the originating MCC shall identify itself and the final destination MCC(s) in plain text; in SIT 605 messages, the final destination is “ALL MCCS”.

42. ENDSIT

This field always contains the code “LASSIT” at the end of every SIT message.

43. ENDMSG

This field is inserted at the end of every current message to be transmitted. It will always follow the “ENDSIT” field (MF #42) “LASSIT”.

44. Number of Spacecraft

The number of spacecraft for which orbit vectors are being transmitted in the SIT message.

45. Message Type

For a SIT 985 message, the Message Type shall be provided as “BEACON OPERATIONAL CHARACTERISTICS”.

For a SIT 185 message, the Message Type shall be provided as three sub-fields in the form “[Beacon Message Type] COSPAS-SARSAT [Alert Status]”, where:

- a) [Beacon Message Type] is “SHIP SECURITY” for a ship security beacon alert, “DISTRESS TRACKING” for an ELT(DT) alert, or “DISTRESS” for all other types of beacons; and
- b) [Alert Status] is the type of alert
 - “POSITION CONFLICT ALERT”
 - “POSITION UPDATE ALERT”
 - “INITIAL ALERT (UNLOCATED)”
 - “INITIAL LOCATED ALERT”
 - “UNRESOLVED DOPPLER POSITION MATCH ALERT”
 - “DOA POSITION MATCH ALERT”*
 - “NOTIFICATION OF COUNTRY OF BEACON REGISTRATION ALERT” or “NOCR”
 - “USER CANCELLATION ALERT”**
 - “ROTATING FIELD UPDATE ALERT”***
 - “UNLOCATED UPDATE ALERT”****

Notes:

- * Provided when DOA and GNSS (i.e., encoded) position in the alert match for an ELT(DT). Only applies to ELT(DT)s.
- ** Provided when cancellation is confirmed, per document C/S A.001 section “Cancellation Message Procedures”. Only applies to ELT(DT)s and SGBs.
- *** Provided when the message is sent due to an update of the beacon message rotating field for an SGB, per document C/S A.001 section “Filtering of Redundant Data”.
- **** Provided when the message is sent due to a new detection without position information.

Not all Alert Status values are applicable with all Beacon Message Types. For example, a Notification of Country of Beacon Registration Alert is not applicable with a Ship Security message type.

If the alert message is sent because the GNSS (i.e., encoded) position does not meet the GNSS-to-GNSS position match criterion (per document C/S A.001) and the GNSS position differs from a previous GNSS position by less than 20 km, then the message type shall indicate “POSITION UPDATE ALERT”.

If the first alert that contains location data does not contain position conflict, or a DOA position match (ELT(DT) only), then the message type shall indicate “INITIAL LOCATED ALERT”.

46. Current Message Number

The message number assigned to this message by the transmitting MCC.

47. MCC Beacon Reference

This reference is a unique designator supplied by the MCC to identify all messages sent for that beacon.

48. Detection Time & Spacecraft ID

The detection time is TCA (as defined at MF #14) and abbreviation for months is as per table below.

For LEOSAR and GEOSAR alerts, the time is followed on the same line by “LEOSAR” or “GEOSAR”, as appropriate, and the identity of the LEOSAR or GEOSAR satellite which provided the alert data.

For MEOSAR alerts, the time of the first burst is provided and is followed on the same line by “MEOSAR”. For MEOSAR alerts the time of the last burst shall be included with the prefix “ALERT LAST DETECTED AT”.

Abbreviation	Month	Abbreviation	Month
JAN	January	JUL	July
FEB	February	AUG	August
MAR	March	SEP	September
APR	April	OCT	October
MAY	May	NOV	November
JUN	June	DEC	December

49. Detection Frequency

For FGBs, the actual beacon detection frequency value shall be reported if available. If no FGB detection frequency is available (e.g., in a LEOSAR solution without Doppler location), the value “406 MHZ” shall be reported (i.e., no decimals).

For SGBs, the actual beacon detection frequency value shall be reported if available. If no SGB detection frequency is available (e.g., in a MEOSAR solution without a DOA position), the value “406.05 MHZ” shall be reported (i.e., only two decimals).

50a. Beacon Message Information

Key information about the beacon derived from the beacon message. If the Beacon Message is invalid per document C/S A.001, section “Alert Message Validation (Filtering Anomalous Data)” – then:

- a) the warning “DATA DECODED FROM THE BEACON MESSAGE IS NOT RELIABLE” shall be included in SIT 185 message (if the associated beacon Id does not match a previous valid beacon Id, per document C/S A.001, section referenced above); or
- b) the warning “NEW BEACON MESSAGE IS NOT RELIABLE. BEACON MESSAGE DATA PROVIDED FROM A PREVIOUS RELIABLE BEACON

MESSAGE” shall be included in SIT 185 message (if the associated beacon Id matches a previous valid beacon, per document C/S A.001, section referenced above).

For any beacon message information field that is part of the associated section per Table C-3, the data line may be omitted if the value is NIL.

50b. Country of Beacon Registration

Three-numeric characters of the Country Code followed by the ten-character abbreviation of the country where the detected beacon is registered as defined on the Cospas-Sarsat website (www.cospas-sarsat.int).

Enter “NIL” if the Beacon Message is invalid per document C/S A.001, section “Alert Message Validation (Filtering Anomalous Data)”.

Enter “N/A” (i.e., not available) if the Beacon Message contains a Country Code in the form “97A” (see document C/S A.001 “Determination of Country Code for Beacons with Country Codes <200 or >780” for further details).

51. Type of Beacon

Beacon type information as per table below and produced from beacon information by the MCC. Otherwise, provide information for beacon type as described below.

Enter “NIL” if the Beacon Message is invalid per document C/S A.001, section “Alert Message Validation (Filtering Anomalous Data)”.

Enter “BEACON TYPE”, then:

“ELT”, followed by “DISTRESS TRACKING” for ELT(DT), or

“PLB”.

Enter “TEST” if SGB message bit 43 = 1. Provide the aircraft or vessel ID and associated Type as available using the format specified for FGBs. TAC is the Cospas-Sarsat type approval certificate number.

“[Aircraft/Vessel ID Type and Aircraft/Vessel ID]”

“TAC [XXXXXX] SERIAL NO. [YYYYYY]” where [XXXXXX] is the TAC number, and [YYYYYY] is the Serial number.

For FGBs and SGBs:

Every vessel/aircraft identifier and Aircraft Operator relevant to beacon type available in the FGB or SGB message shall be provided.

If a beacon message contains the value “ZGA” as the Aircraft Operator; then the aircraft operator designator shall be provided as “ZGA (AIRCRAFT OPERATOR NOT AVAILABLE)”.

If the SGB message contains identification information on the vessel/aircraft type, then the vessel/aircraft type shall be provided, and when a secondary vessel/aircraft identifier is available, an associated title shall be provided, as follows.

VESSEL ID TYPE	2nd Vessel ID Title	Additional Information
MMSI	EPIRB-AIS ID (SGB only)	If available, the EPIRB-AIS ID is provided in the format “974XXNNNN”, where 974 is fixed, and XXNNNN is encoded in the SGB message and “zero-filled” (e.g., encoded value 4123 is shown as “040123”).
RADIO CALL SIGN	not applicable	A 2 nd Vessel ID is not available.
TAIL NUMBER	not applicable	A 2 nd Vessel ID is not available.
AIRCRAFT 24 BIT ADDRESS	AIRCRAFT OPERATOR DESIGNATOR*	* The 2 nd Vessel ID Title and 3-letter aircraft operator designator (3LD) are provided, when the 3LD is available.
AIRCRAFT OPERATOR	AIRCRAFT OPERATOR SERIAL NUMBER	The serial number for the Aircraft Operator.
SYSTEM TEST	not applicable (national use only)	Alerts for System test beacons are normally not sent to SPOCs, but may be sent as part of a controlled system test. National use information encoded in the SGB message Vessel ID field may be included.

If the registration marking corresponding to the 24-bit address is known, it shall be given. If the registration marking is unknown, the full 24-bit address shall be given as a six-character hexadecimal number. For protocol containing the aircraft 24-bit address, the country which assigned the 24-bit address shall be indicated. If the country that assigned the 24-bit address is unknown, this value shall be set to “UNKNOWN”.

Note: The data line for this message field may be omitted if the value is “NIL”.

52. Identification

The identification information as described in the Cospas-Sarsat beacon specifications per documents C/S T.001 and C/S T.018.

Enter “NIL” if the Beacon Message is invalid per document C/S A.001, section entitled “Alert Message Validation (Filtering Anomalous Data)”.

Note: The data line for this message field may be omitted if the value is “NIL”.

53. Emergency Code

The emergency code as indicated by the beacon coding as described in the Cospas-Sarsat beacon specification.

Enter “NIL” if the Beacon Message is invalid per document C/S A.001, section entitled “Alert Message Validation (Filtering Anomalous Data)”.

Note: The data line for this message field may be omitted if the value is “NIL”.

54. Alert Position Information

Alert detection information (including detection time and satellite) and position information associated with the MCC reference position, A & B Doppler positions, DOA position and the GNSS (i.e., encoded) position as appropriate. Any data line for position (e.g., MCC reference position, DOA position) may be omitted if no associated position is available for the data line.

54a. MCC Reference Position

Latitude and longitude of the MCC reference position. This position may be formed by a merge of matching positions, which may be based on a weighting factor assigned to each matching position.

See section “Confirmation of Beacon Positions” in document C/S A.001 and section “General Principle / Confirmation” in document C/S G.007.

Note: The data line for this message field may be omitted if the value is “NIL”.

54b. A Position & Probability

The latitude and longitude of the A Doppler Position and the percentage probability that the A Position is the actual position of the incident. If the A Position (but not the B position) matches the MCC reference position, per the Position Matching criteria specified in document C/S A.001, then the A Probability and/or the B Position information (including the B Probability) may be omitted from the message.

Note: The data line for this message field may be omitted if the value is “NIL”.

54c. B Position & Probability

Same as MF #54b above but for B Position.

54d. DOA Position, Accuracy and Altitude

Latitude and longitude of the DOA position with expected accuracy (i.e., estimated error) in nautical miles. The accuracy uses the value of the expected horizontal error, rounded up. If the expected horizontal error has the default value of “000.00”, the accuracy¹ is “UNKNOWN”. If the expected horizontal error is greater than 277.8 km (150 NM), the accuracy is shown as “OVER 150 NMS”.

(1) If the reporting MEOLUT is not commissioned to meet MEOSAR IOC requirements for DOA position accuracy and the reliability of the EHE as specified in document C/S T.020, the expected horizontal error shall be defaulted in MF #54d (text set to “UNKNOWN”). The MEOLUT capability to provide the EHE reliably shall be configured in the MCC separately for FGBs and SGBs.

The altitude of the DOA position is provided from the mean sea level in metres. The DOA altitude is not verified as part of MEOLUT commissioning and shall be set to “NIL” until further notice².

(2) As a future enhancement, the altitude of the DOA position could be provided when a related MEOLUT requirement is specified in documents C/S T.019 and C/S T.020, the MEOLUT is appropriately commissioned, and the altitude (MF #82) does not contain a default value of “99.999999”.

Note: The data line for this message field may be omitted if the value is “NIL”.

54e. GNSS Position, Time of Update and Altitude

Latitude and longitude of GNSS (i.e., encoded) position. Enter “NIL” if the Beacon Message is invalid per document C/S A.001, section entitled “Alert Message Validation (Filtering Anomalous Data)” or if the GNSS position is not provided.

For FGBs:

If the GNSS position is provided, then:

- a) if an ELT(DT), set the Time of Update to:

“UPDATE TIME WITHIN [AAAA] OF DETECTION TIME” where [AAAA] is:

 - “0 - 2 SECONDS”,
 - “2 - 60 SECONDS”, or
 - “1 MINUTE TO 4 HOURS”,

based on bits 113 to 114;
- b) otherwise, set the Time of Update to “UPDATE TIME WITHIN 4 HOURS OF DETECTION TIME” for an FGB.

If location data is present in PDF-1 for an FGB ELT(DT) location protocol, then information shall be provided on the GNSS position altitude based on the usability of PDF-2 and bits 109-112, as follows:

- “ALTITUDE OF GNSS LOCATION LESS THAN 400 METRES (1300 FEET)”,
- “ALTITUDE OF GNSS LOCATION BETWEEN [XXXX1] AND [YYYY1] METRES (BETWEEN [XXXX2] AND [YYYY2] FEET)”, where [XXXX1] and

[YYYYY1] are the values provided in document C/S T.001 and [XXXXX2] and [YYYYY2] are the corresponding values rounded to the nearest hundreds of feet,

- “ALTITUDE OF GNSS LOCATION GREATER THAN 10000 METRES (32800 FEET)”, or
- “ALTITUDE OF GNSS LOCATION NOT AVAILABLE”.

For SGBs:

The following information about the GNSS location shall be indicated, if available, using data from the beacon message:

- For an ELT(DT), “TIME OF GNSS POSITION UPDATE:” followed by the time of the GNSS position update, per format specified for MF #48b,
- “TIME SINCE GNSS LOCATION GENERATED: [nnnn] MINUTES” if the value < 2046,
or
“TIME SINCE GNSS LOCATION GENERATED: 2046 MINUTES OR MORE” if the value = 2046, and
- “ALTITUDE OF GNSS LOCATION: [nnnnn] METRES ([yyyyyyy] FEET)” where the value in feet is rounded to the nearest foot.

Note: The data line for this message field may be omitted if the value is “NIL”.

54f. DOA Speed

Estimated speed for DOA position. The speed estimates field provides the independently estimated course in degrees, horizontal speed in m/s, vertical speed in m/s and expected speed error in m/s.

Note: no information shall be provided for this message field until the associated MEOLUT is commissioned to provide DOA Speed information.

55. Source of GNSS Position Data

This indicates whether the GNSS (i.e., encoded) position data was provided to the beacon by an internal or external device. Enter “NIL” if the Beacon Message is invalid per document C/S A.001, section entitled “Alert Message Validation (Filtering Anomalous Data)”.

Note: The data line for this message field may be omitted if the value is “NIL”.

56. (Not used – previously “Next Pass / Expected Data Times”)

57a. Beacon HEX ID

Hexadecimal representation of beacon identification code per the section titled “Beacon Identification” of document C/S A.001 (15 characters for an FGB or 23 characters for an SGB) and type of homing signal as per table below.

The last 11 characters of the 23 character hexadecimal identification code shall be provided with a space after the first 12 characters. Information is taken from the Beacon Message (reference MF #23, MF #77 or MF #90) by the MCC.

If the Beacon Message of an FGB is invalid per document C/S A.001, section entitled “Alert Message Validation (Filtering Anomalous Data)”, then the fifteen-character hexadecimal representation shall be based on bits 26 - 85 of the Beacon Message with no bits defaulted.

57b. Homing Signal

Interpretation

<u>Term:</u>	<u>Meaning:</u>
“NIL”	no homing transmitter or, for SGB only, no homing device is functional after beacon activation.
“121.5”	121.5 MHz ELT/EPIRB signal in addition to 406 MHz (FGB).
“MARITIME”	9 GHz Search and Rescue Radar Transponder (SART) in addition to 406 MHz (FGB).
“OTHER”	a nationally assigned signal has been included in the beacon (FGB).
“NIL OR NOT 121.5”	no homing transmitter or homing transmitter other than 121.5 MHz (FGB: National, Standard or RLS Location Protocol).
“YES”	SGB homing is active (after beacon activation) or SGB homing device is present (on beacon activation).

For SGBs, additional information may be provided based on the TAC number.

Note: The data line for this message field may be omitted if the value is “NIL”.

58. Activation Type

Type of beacon activation for USER protocols only (i.e., FGB non-location protocols):

- “MANUAL” if Bit 108 is set to “0”
- “AUTOMATIC OR MANUAL” if Bit 108 is set to “1”

For Ship Security (Standard Location Protocol), enter “MANUAL”.

If otherwise available using data from the beacon message, the activation method of the beacon shall be indicated as either:

- “MANUAL”,
- “AUTOMATIC BY BEACON” *,
- “AUTOMATIC BY BEACON (G-SWITCH/PROBABLE CRASH)” **,
- “AUTOMATIC BY EXTERNAL MEANS (AVIONICS)” **,

* Does not apply to ELTs and ELT(DT)s.

** Only applies to ELTs and ELT(DT)s,

If no information is available in the current alert, then the activation type is provided from the most recent alert (based on detect time) with available information. Enter “NIL” if no information is available or the Beacon Message is invalid per document C/S A.001, section entitled “Alert Message Validation (Filtering Anomalous Data)”.

Note: The data line for this message field may be omitted if the value is “NIL”.

59. Beacon Number

Beacon number on the vessel or aircraft, with the first beacon on the vessel or aircraft designated as “0”. Information is determined by decoding the 406 MHz message.

Enter “NIL” if no information is available or the Beacon Message is invalid per document C/S A.001, section entitled “Alert Message Validation (Filtering Anomalous Data)”.

Note: The data line for this message field may be omitted if the value is “NIL”.

60. Other Encoded Information

Other information decoded from the Beacon Message as determined by the servicing MCC. Could include such information as Cospas-Sarsat type approval certificate (TAC) number, resolution of the GNSS position data, or data according to national assignment. If the TAC number is provided, it shall be preceded by “TAC”. Note that the TAC number is provided for SGBs as part of User Class of Beacon (MF #51).

For FGBs:

When GNSS position data is present, the degree of uncertainty (i.e., the maximum possible difference between the GNSS position processed by the beacon and the GNSS position transmitted in the SIT 185 message) shall be provided as follows:

For user location protocol beacons when location data is present in PDF-2 enter:

- “GNSS POSITION UNCERTAINTY PLUS-MINUS 2 MINUTES OF LATITUDE AND LONGITUDE”.

For Standard, National, Return Link Service (RLS) and ELT(DT) location protocol beacons when location data is present in PDF-2 enter:

- “GNSS POSITION UNCERTAINTY PLUS-MINUS 2 SECONDS OF LATITUDE AND LONGITUDE”.

For standard location protocol beacons when location data is present in PDF-1 and missing in PDF-2 enter:

- “GNSS POSITION UNCERTAINTY PLUS-MINUS 30 MINUTES OF LATITUDE AND LONGITUDE”.

For national location protocol beacons when location data is present in PDF-1 and missing in PDF-2 enter:

- “GNSS POSITION UNCERTAINTY PLUS-MINUS 4 MINUTES OF LATITUDE AND LONGITUDE”.

For RLS and ELT(DT) location protocol beacons when location data is present in PDF-1 and missing in PDF-2 enter:

- “GNSS POSITION UNCERTAINTY PLUS-MINUS 15 MINUTES OF LATITUDE AND LONGITUDE”.

For SGBs:

If an SGB lacks GNSS position capability, enter:

- “BEACON DOES NOT HAVE GNSS POSITION CAPABILITY”.

When GNSS location data is present, the degree of uncertainty shall be provided by

- “GNSS POSITION UNCERTAINTY PLUS-MINUS 10 METRES”.

Other information shall be indicated, if available, using data from the beacon message:

- “ELAPSED TIME SINCE ACTIVATION: [nn] HOURS” if the value < 63, or
“ELAPSED TIME SINCE ACTIVATION: 63 HOURS OR MORE” if the value = 63,

where the time since activation is truncated, and

- “REMAINING BATTERY CAPACITY: BETWEEN [nn] AND [nnn] PERCENT”.

Note: The data line for this message field may be omitted if the value is “NIL”.

61a. Other Information (General)

Information obtained separately from encoded beacon information such as:

- reliability indicator for GNSS, DOA or Doppler position data *,
- database registry information,
- optionally the number of packets used to generate the alert (based on MF #88, MEOSAR only),
- optionally the number of MEOSAR satellites used to generate the alert,
- optionally the LUT identification,
- people on board,
- “NIL” if not available.

The statement, “THE [A/B] POSITION IS LIKELY TO BE AN IMAGE POSITION.” shall be included, as appropriate, per the “LEOSAR Image Position Determination” algorithm in Appendix B.2 to Annex B.

Notes :for * above:

- 1: The warning “RELIABILITY OF DOPPLER POSITION DATA – SUSPECT DUE TO TECHNICAL PARAMETERS” for DOPPLER 406 MHz solutions shall be included on the SIT 185 message when at least one of the following criteria from the alert data values is satisfied:
 - Window factor ≥ 3 , or
 - Bias standard deviation > 20 Hz, or
 - The absolute value of the cross track angle is < 1 or > 22, or
 - Position calculated from < 4-point solution.

- 2: The warning “RELIABILITY OF DOPPLER POSITION DATA - SUSPECT DUE TO SATELLITE MANOEUVRE.” shall be included in the SIT 185 message during the 24-hour period after the manoeuvre, when the maximum expected error in Doppler location exceeds ten (10) kilometres within 24 hours of the manoeuvre. See document C/S A.001, section entitled “Scheduled Satellite Manoeuvres”.
- 3: The warning “WARNING: AMBIGUITY IS NOT RESOLVED” shall be included in the SIT 185 message for an Unresolved Doppler Position Match, as defined in document C/S A.001, section entitled “Position Matching”
- 4: The warning “RELIABILITY OF DOA POSITION DATA - SUSPECT DUE TO SATELLITE FOOTPRINT CHECK” shall be included in the SIT 185 message if the MCC determines that the DOA position is outside the footprint of any reporting satellite. See Figure B.2.
- 5: The warning “RELIABILITY OF DOPPLER POSITION DATA - SUSPECT DUE TO SATELLITE FOOTPRINT CHECK” shall be included in the SIT 185 message if the MCC determines that the DOPPLER position is outside the footprint of any reporting satellite. See Figure B.2.

The statement “POSITION CONFLICT BASED ON DISTANCE SEPARATION OF AT LEAST 20 KM” shall be included in the SIT 185 Position Conflict message.

The statement “ELT(DT) POSITION DOES NOT REFERENCE ANY PREVIOUS POSITION” shall be included if the beacon type is ELT(DT) and the alert contains position data.

The statement “POSITION UPDATE BASED ON DISTANCE SEPARATION OF 3 TO 20 KM OR FIRST REFINED GNSS POSITION” shall be included in the SIT 185 message if the alert message is sent because:

- a) the GNSS (i.e., encoded) position does not meet the GNSS position match criterion (per document C/S A.001, section entitled “Position Matching”) and the GNSS position differs from a previous GNSS position by less than 20 km; or
- b) the new GNSS position is refined, no previous refined GNSS position has been sent, and a coarse GNSS position was previously sent.

If the alert is an uncorroborated MEOSAR alert, then:

- a) the warning “UNCORROBORATED MEOSAR ALERT” shall be provided in the SIT 185 message; and
- b) the statement “UNCORROBORATED MEOSAR ALERT: BEACON IS REGISTERED” shall be provided in the SIT 185 message, if it is determined that the associated beacon ID is registered.

Uncorroborated MEOSAR alerts are distributed in accordance with document C/S A.001, section “Uncorroborated MEOSAR Alerts”.

If cancellation is confirmed as specified in document C/S A.001 section “Cancellation Message Procedures”, then the statement “CANCELLATION CONFIRMED” shall be included in the SIT 185 message.

If information on beacon characteristics is available for the Type Approval Certification (TAC) number encoded in the beacon message, based on relevant information provided at the Cospas-Sarsat website link [TBD] and in SIT 927 messages, then the following statement shall be provided: “BEACON CHARACTERISTICS PER TAC DATABASE PROVIDED IN A SEPARATE MESSAGE”.

If beacon registration information is available and provided in a single SIT 925 message, then the following statement shall be provided: “BEACON REGISTRATION INFORMATION PROVIDED IN A SEPARATE MESSAGE”.

If the LUT identification is provided, it shall include the prefix “LUT ID”, include the 4 digit identification per MF #11 and optionally include a name for the LUT.

61b. Hex ID (Beacon Operational Characteristics)

23 character hexadecimal beacon identification per the section titled “Beacon Identification” of document C/S A.001, with a space provided after the first 12 characters.

61c. TAC Data (Beacon Operational Characteristics)

Based on relevant information provided at the Cospas-Sarsat website and in SIT 927 messages, information on operational characteristics of a beacon associated with the Type Approval Certification (TAC) number encoded in the beacon message shall be provided as follows:

- “CHARACTERISTICS FOR TAC [NNNNNNNN]”
- “- MANUFACTURER:”
- “- BEACON MODEL:”
- “- [DATA LINE N]”
- “- [DATA LINE N]”

where [NNNNNNNN] is the TAC number, and each data line [DATA LINE N] contains one data field, in the format “Field-ID: Field-Value”, per the description of MF #97 in this Appendix.

62. Remarks

Heading for the variable length section of the message. Additional information may be provided at the discretion of the originating MCC as illustrated in the sample alert messages. “NIL” if no Remarks are available. Remarks about beacon type (e.g., for ship security beacons and return link beacons) are not provided if the Beacon Message is invalid per document C/S A.001, section entitled “Alert Message Validation (Filtering Anomalous Data)”.

- 1- For ship security alerts, the following should be included:

“This is a ship security alert. Process this alert according to relevant security requirements.”

- 2- For ELT(DT) alerts, the following shall be included:

“THIS DISTRESS TRACKING MESSAGE IS BEING SENT TO APPROPRIATE SAR AUTHORITIES” and “PROCESS THIS ALERT ACCORDING TO RELEVANT REQUIREMENTS”.

- 3- For a return link beacon alert, if the second protected data field of an FGB (bits 107-132) is not usable, or the RLS rotating data field of an SGB is not usable or available, then indicate:

“THIS BEACON HAS RETURN LINK CAPABILITY”.

- 4- For a return link beacon alert, if the second protected data field of an FGB. or the RLS rotating data field of an SGB is usable, then provide two lines in the following format, as described below:

“THIS BEACON HAS [RLS-ID] RETURN LINK CAPABILITY

RLM TYPE-[X] [RECEIVED/CAPABLE] ([AUTO/MANUAL] ACKNOWLEDGEMENT)”

In line 1, replace “[RLS-ID]” with “GALILEO”, “GLONASS” or blank based on FGB bits 113 – 114 or SGB bits 167 – 169.

In line 2, replace [X] with “1” or “2”, replace “[RECEIVED/CAPABLE]” with “RECEIVED” or “CAPABLE”, and replace “[AUTO/MANUAL]” with “AUTOMATIC” or “MANUAL” based on FGB bits 109 – 112 or SGB bits 161 – 162 and 170 – 171.

Note: TYPE-1 provides “AUTOMATIC” acknowledgement and TYPE-2 provides “MANUAL” acknowledgment.

63. End of Message

To indicate to the message recipient that no more information is to come on this message.

64. SARR Frequency Calibration Offset

Difference (in Hz) between the computed frequency produced by the calibration LEOLUT and the known transmit frequency of a reference beacon.

The SARR frequency calibration offset prepared for distribution to other MCCs shall be based on the average of a minimum of twenty satellite passes, each of which includes at least ten data measurements and each of which is associated with a computed location which is accurate to within three kilometres.

65. SARR Frequency Calibration Drift

Drift (in Hz/day) of the SARR frequency provided by the LEO satellite.

66. Time of SARR Frequency Calibration Determination

Time when a SARR frequency calibration offset for a given LEO satellite was determined through the procedure described for MF #64.

See the note under MF #69.

67. Uplink TOA ‡

Time that the burst is received at the satellite as calculated by the MEOLUT.

The time reference point (anchor) of a 406 MHz SAR burst for an FGB is the end of the 24th bit in the message Preamble. The end of the 24th bit is defined as the mid-point of the 50% phase crossing (i.e., “zero-crossing”) of the mid-transitions of the 24th and 25th bit.

The time reference point (anchor) of a 406 MHz SAR burst for an SGB is the beginning of the first chip of the I channel of the local replica that best matches the received signal.

68. Uplink FOA ‡

Burst frequency measured at the time of the Uplink TOA.

See the note under MF #70.

69. Time Offset †

This is the calculated difference in time between the reception of the beacon burst at the satellite and the ground station. Adding this offset to the Uplink TOA provides the time the burst was received at the ground station.

† If the offset is set to the default value, the Uplink TOA refers to the time when the anchor point was received at the ground station (i.e., offset is included). The intended use of the default value pertains to “antenna only” installations that may not have the capacity to compute this offset.

70. Frequency Offset

This is the offset in frequency due the relative motion between the satellite and the antenna at the ground station. The frequency offset depends on the downlink frequency (either L-band or S-band).

The frequency offset is computed using the following formula:

- $\Delta f = -f_d \cdot \frac{V_{rad}}{c}$ for satellites without spectral inversion in payload,
- $\Delta f = +f_d \cdot \frac{V_{rad}}{c}$ for satellites with spectral inversion in payload,

with f_d the downlink frequency, V_{rad} is radial velocity of the satellite relative to the LUT, and c is the speed of light.

Note: If the offset is set to the default value, the Uplink FOA refers to the frequency measured at the ground station (i.e., offset is included). The intended use of the default value pertains to “antenna only” installations that may not have the capacity to compute this offset.

71. Antenna ID

The identification code corresponding to the individual antenna associated with the ground station that originally provided the burst data being reported in the SIT message.

72. C/N₀

The Carrier over Noise Density of the detected burst as determined by the ground station.

73. Bit Rate

The number of bits per second as measured by the ground station.

74. Spare Data

This field consists of four hexadecimal characters as place holders for additional information.

75. Satellite Position (Optional)

The X, Y and Z components of the satellite position with respect to the centre of the earth in kilometres, in the earth-fixed co-ordinate system and in effect at the time specified by MF #67.

76. Satellite Velocity (Optional)

The X, Y and Z components of the satellite velocity vectors with respect to the centre of the earth in kilometres per second, in the earth-fixed co-ordinate system and in effect at the time specified by MF #67.

77. FGB Full 406 Message

The 406 MHz binary message of the solution for an FGB, in its undecoded form, shown in the full 36-hexadecimal character representation. Set to all zeroes for interference data (SIT 141 message).

78. DOA Quality Factor

A measure of quality associated with the DOA position (algorithm TBD). A higher number indicates higher quality.

79. Average Carrier to Noise Ratio

The average Carrier to Noise Ratio (dB-Hz) as computed from all contributing TOA/FOA measurements, computed by taking the log of the average of inverse logs of all measurements.

80. Networked Antenna Channels

Number of networked antenna channels used to generate this alert. “99” indicates that information is not available for a networked MEOLUT.

If the number of networked antenna channels exceeds 98, the value is set to “98”.

81. Antenna Channels

Number of antenna channels used to generate this alert.

If the number of antennas exceeds 99, the value is set to “99”.

82. Altitude

The calculated altitude of the DOA position relative to an ellipsoid (WGS84), given in kilometres.

83. Satellite IDs

The list of satellites used to compute the solution for this alert. The satellites are listed in the same sequence as the antennas specified in MF #93, when MF #93 is present.

Unused satellite entries are filled with zeroes.

84. Quality Indicator

This field is used to provide additional information regarding the quality or quality related processing performed by MEOLUTs and/or MCCs. If not used it contains the default value (00). Otherwise the following values are defined: Bit values are defined to be additive (i.e., value 6 = 2 + 4), where the “1” bit is the least significant digit and the “8” bit is the most significant digit.

- 1 MEOLUT Single Burst Location Confirmation performed: position confirmed,
- 2 MEOLUT Single Burst Location Confirmation performed: position not confirmed,
- 4 DOA Position Outside Satellite Footprint.

85. Two-Line Element (TLE) Set Format - Line 1

1 nnnnnu nnnnnaaa nnnnn.nnnnnnnnn +.nnnnnnnnn +nnnnn-n +nnnnn-n n nnnnn

Note: Fields within this Line may contain leading blanks, as described below.

Column	Description
01	Line Number of Element Data
03-07	Satellite Number
08	Classification (U=Unclassified)
10-11	International Designator (Last two digits of launch year)
12-14	International Designator (Launch number of the year)
15-17	International Designator (Piece of the launch)
19-20	Epoch Year (Last two digits of year)
21-32	Epoch (Day of the year and fractional portion of the day). May contain leading blanks.
34-43	First Time Derivative of the Mean Motion
45-52	Second Time Derivative of Mean Motion (decimal point assumed)
54-61	BSTAR drag term (decimal point assumed)
63	Ephemeris type
65-68	Element number
69	Checksum (Modulo 10) (Letters, blanks, periods, plus signs = 0; minus signs = 1)

86. Two-Line Element (TLE) Set Format - Line 2

2 nnnnn nnn.nnnn nnn.nnnn nnnnnnnn nnn.nnnn nnn.nnnn nn.nnnnnnnnnnnnnnnnn

Note: Fields within this Line may contain leading blanks, as described below.

Column	Description
01	Line Number of Element Data
03-07	Satellite Number
09-16	Inclination [Degrees]
18-25	Right Ascension of the Ascending Node [Degrees]
27-33	Eccentricity (decimal point assumed)
35-42	Argument of Perigee [Degrees]
44-51	Mean Anomaly [Degrees]
53-63	Mean Motion [Revs per day]
64-68	Revolution number at epoch [Revs]. May contains leading blanks.
69	Checksum (Modulo 10)

87. MEOSAR orbit reference coordinate system

Has one of two possible values:

- “ECEF” - Earth-Centred Earth-Fixed (a coordinate system that rotates with the Earth),
- “ECI” - Earth-Centred Inertial (a coordinate system that does not rotate with the Earth).

88. Number of Packets

Number of packets (i.e., distinct TOA/FOA measurements) used to generate this alert.

89. Expected Horizontal Error

The expected horizontal error is a value between 000.00 and 999.99 kilometres and provides an indication of the accuracy of a DOA location. The value of 999.99 is used if the expected horizontal error is greater than 999.99. The default value of “000.00” indicates that the expected horizontal error is unknown.

The Expected Horizontal Error is the radius of the circle that is centered on the estimated location and contains the true location with a probability of $95 \pm 2 \%$.

90. Second Generation Beacon (SGB) Data

51 hexadecimal characters (204 bits) comprised as follows:

- bit 1: self-test indicator based on PRN sequence detected by the MEOLUT (0 = normal mode, 1 = self-test mode),
- bit 2: 0 (spare),
- bits 3 to 204: data bits 1 - 202 of the most recent, valid SGB message (i.e., after BCH correction) for the solution, as described in Figure “Message content bits” of document C/S T.018.

The effective time of the beacon data is the last detect time (MF #14b for MEOLUT data). If a valid SGB message is not available, the most recent SGB message for the solution is provided.

91. Beacon Message BCH Error Indicator

Flag to indicate the number of corrected bits in the beacon message. Value is 0 (if the BCH was correct), 1 to 6 (if the BCH has been corrected) or “N” (if the BCH correction was not possible). For FGBs, this value refers to the BCH-1 field only, and the maximum number of corrected bits is limited to 3.

92. 23 Hex Beacon ID

The 23 hexadecimal character SGB ID, per Table “Hex ID Contents” of document C/S T.018.

93. MEOSAR Antenna IDs

The list of antennas used to compute the solution for this alert. The antenna ID is composed of the four-digit LUT identifier followed by the two-digit antenna identifier per MEOLUT. The two-digit antenna identifier shall be set to a unique value for each phased-array antenna.

The antennas are listed in the same sequence as the satellites in MF #83, so that information is provided about each satellite antenna pair that contributed to the solution, including local and networked antennas.

Unused antenna entries are filled with zeroes. If there is not enough space in the message to add all the local and networked antennas, priority should be given to the local antennas.

94. C/S Type Approval Certificate (TAC) Number information

The first TAC number is the first TAC number for which information is provided in the SIT 927 message.

The Count of Current TAC Numbers is the number of consecutive TAC numbers for which information is provided in the SIT 927 message, so that the last TAC number for which information is provided in the SIT 927 message = “First TAC Number” + “Count of Current TAC Numbers” - 1.

The TAC Number Total indicates the total number of TACs for which related database information is available, including the range of TAC number for which information is provided in the SIT 927 message.

The TAC Sequence Number is assigned by the originating MCC and incremented each time it provides new or updated information about a range of TAC numbers in a SIT 927 message; this value is maintained when a SIT 927 message is retransmitted or forwarded by any MCC.

Destination MCCs may use the TAC Number Total and TAC Sequence Number to help determine if their local repository of TAC related information (i.e., their TAC database) is up to date.

The Device Type indicates the type of device which the TAC range is assigned:

“B” = Beacon,

“A” = Programming Adapter.

The use of Programming Adapters is described in section ‘Programming Adapters’ of document C/S T.018.

95. Beacon Manufacturer Name

The name of the beacon manufacturer for the associated TAC number, whether the TAC number is allocated to a beacon model or to a programming adapter.

96. Beacon Model Name

The name of the beacon model for the associated TAC number, whether the TAC number is allocated to a beacon model or to a programming adapter.

97. Beacon Data Field

Beacon data field narrative text for the associated beacon model. Each data line contains one data field, in the format “Field-ID: Field-Value”; e.g., “BEACON SUBTYPE: ELT(DT)”. The data line length is limited to 64 characters, so that associated information can be included directly in a SIT 185 message data line (69-character limit); 5 characters (i.e., 69 – 64) in the SIT 185 data line are reserved for alignment. The data field shall contain all relevant information for the associated TAC number, so that the beacon data field provided in a new SIT 927 message replaces all beacon data provided in a previous SIT 927 message for a specific TAC number. Defined data fields are provided below.

Field ID	Allowable Data Values	Remarks
BEACON TYPE	ELT, EPIRB, PLB	
BEACON SUBTYPE	For ELTs: (DT), (AF), (AP), (S), or (AD) For EPIRBs: FLOAT-FREE or NON-FLOAT-FREE	If no information is available, then the field is not provided.
TEMPERATURE RANGE		Operating temperature range, per document C/S T.018.
HOMING	Type-1=Power Level, Type-2=Power Level, Type-n=Power Level... or “NONE”. Example: “406=25MW, AIS=20 MW”	Identify each available type of homing and the associated power level, where “Type” is “121.5”, “243”, “406”, “AIS” or other value. “Power level” is typically provide in milli-watts (e.g., “25 MW”). The value is “NONE” if no homing capability is available.
GNSS RECEIVER	YES, NO	The beacon has a GNSS receiver: “YES” or “NO”. If the field is not provided, then it is assumed that the value is “NO”.
NAT PROTOCOL	YES, [description]	If national protocol, indicate “YES” followed by description. If not

		national protocol, then the field is not provided.
VOICE FREQUENCY	NNN.NN MHZ	Voice transmission frequency, if voice transmission capability is available; if not available, then the field is not provided.
STROBE	BRIGHTNESS=nn.nn CANDELA, DUTY-CYCLE= nn FLASH/MINUTE	If a strobe is available, indicate brightness and duty cycle; if a strobe not available, then the field is not provided.
BATTERY DURATION	NN HOURS	Tested life for battery duration. If no information is available, then the field is not provided.
OTHER	Free form description	Other information about beacon characteristics. If no information is available, then the field is not provided.

Beacon Characteristics Field Description

APPENDIX B.2 TO ANNEX B

DETERMINING THE LEOSAR IMAGE POSITION AND VALIDATING THE SATELLITE FOOTPRINT

The LEOSAR Doppler processing produces two solutions for each satellite pass; a “real” position corresponding to the actual location of the beacon and an “image” position on the opposite side of the satellite track. Prior to determining the “real” position of a beacon, it is possible to use unlocated alert data to determine if one position is an image, as summarised in Figure B.2.

The LEOSAR image position can be determined using the following inputs:

- a) LEOSAR Doppler alert, including beacon ID, A and B latitude/longitude positions (defined as Input “I₂” in the DDP);
- b) GEOSAR or LEOSAR unlocated alert with beacon ID (defined as Input “I₁” in DDP); and
- c) ephemeris data and orbit propagation software, if the unlocated alert originated from a LEOSAR satellite, or the position of the GEOSAR satellite if the alert originated from a GEOSAR satellite.

Figure B.1 and the text below document the procedures for MCCs to follow to determine if a position is inside the footprint of the LEOSAR or GEOSAR satellite at time of detection, and whether a position is an image.

The process of determining an image position is triggered when a LEOSAR Doppler alert (I₂) is received at the MCC (reference process 1 in Figure B.1) for a beacon which has been previously detected, but no location information is available (I₁). The status of the MCC processing prior to receiving the LEOSAR Doppler alert must be at Sw₁ (i.e., only identification information available, no location information present). If the status of the MCC processing is not at Sw₁, then an image position will not be indicated when the alert message is sent by the MCC.

All unlocated alerts on file with a detect time within 60 minutes of the Doppler TCA are examined (reference 3) to determine if the image position can be determined. For LEOSAR unlocated alerts the time of the detection, along with orbit propagation software, is used to determine the sub-satellite position of the LEOSAR satellite at time of detection (reference 4). For GEOSAR satellites the sub-satellite position is obtained from www.cospas-sarsat.int (reference 5).

Each of the LEOSAR Doppler positions are analysed to determine if they are within the GEOSAR or LEOSAR unlocated footprint using the algorithm shown in Figure B.2 and using the sub-satellite points as input (reference 6). Each unlocated footprint must be analysed before a position can be determined to be an image.

If one of the LEOSAR Doppler positions is conclusively outside the footprint for at least one unlocated alert, then it is the image position, as long as the other position is inside the footprint of every unlocated alert. If neither position is outside of any footprint or each position is outside of any footprint, then the image position cannot be determined.

When a position has been determined to be an image, this will be indicated on the alert message sent by the MCC, as specified in the description of MF #24 and MF #61a in Appendix B.1 to Annex B.

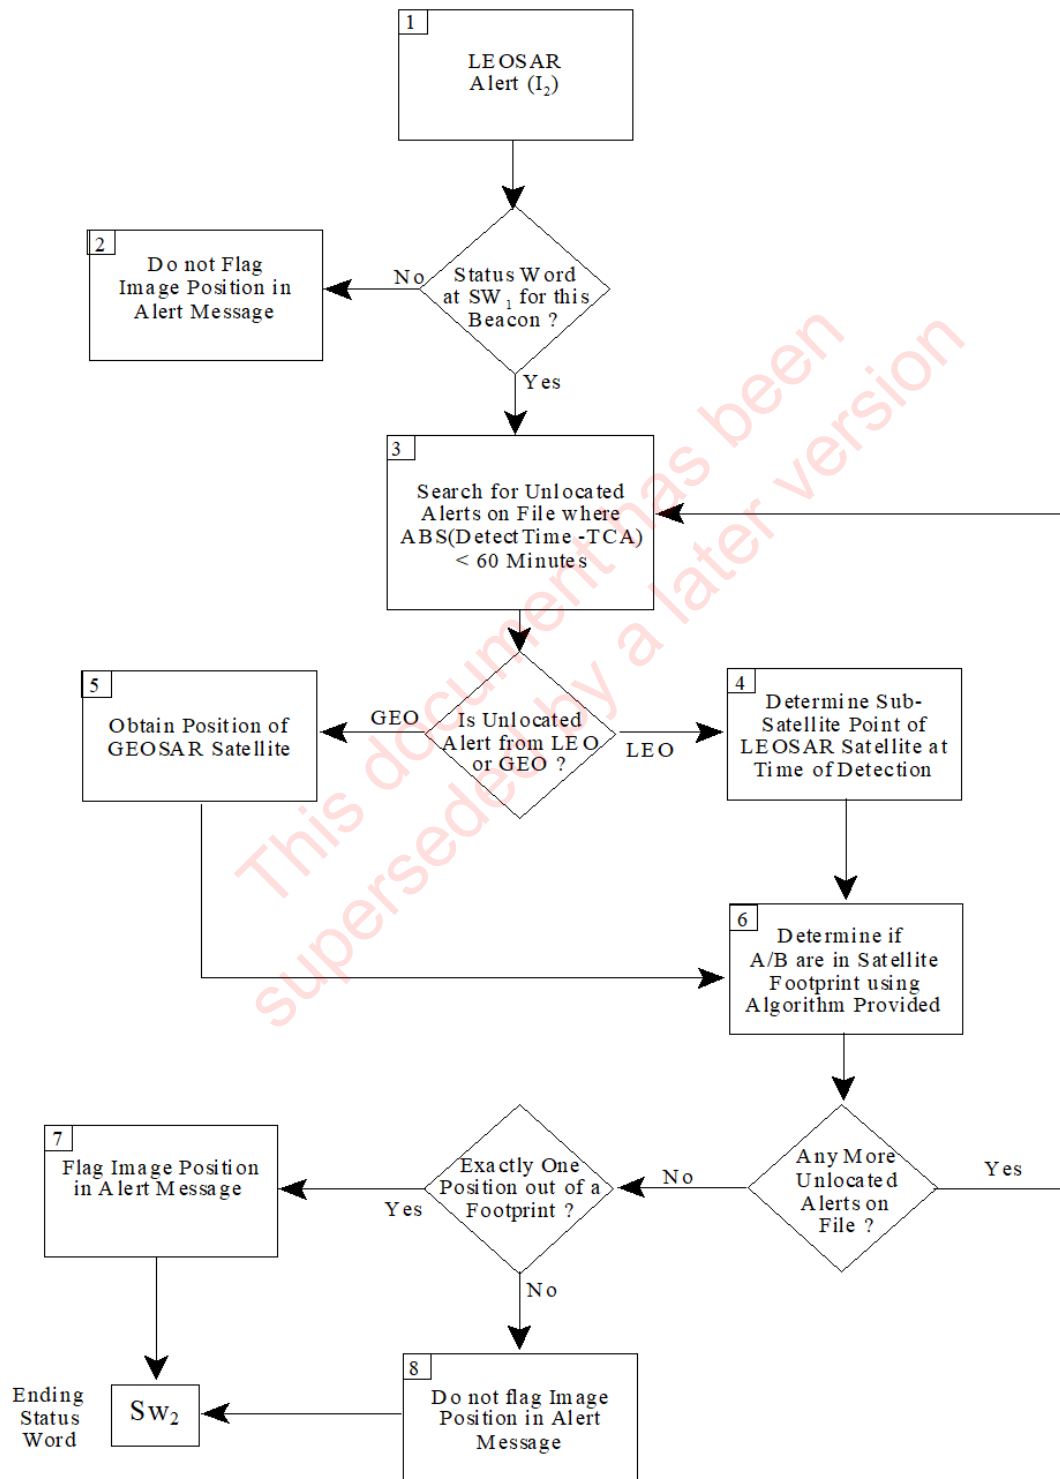

Figure B.1: Using Unlocated Alerts to Determine and Flag the Image Position

To determine if MEOSAR DOA and/or GNSS (i.e., encoded) position is within the footprint of the associated MEOSAR satellite(s), the time of the detection, along with orbit propagation software, is used to determine the sub-satellite position of the MEOSAR satellite at time of detection. The algorithm to determine this is provided at Figure B.2.

When a DOA or GNSS (i.e., encoded) position has been determined to be outside the footprint of any reporting MEOSAR satellite, at both the first and last detect times of the associated alert then the action described in document C/S A.001, section entitled “Alert Message Validation (Filtering Anomalous Data)” is to be followed.

Input:	lat	estimated position latitude in degrees
	lon	estimated position longitude in degrees
	llat	sub-satellite point at time of detection, latitude in degrees
	llon	sub-satellite point at time of detection, longitude in degrees
	Emin	Minimum elevation angle required (set to -5 degrees)
Constants:	Rg	altitude of satellite (note differences among the various satellite constellations)
	Re	Equatorial radius of earth = 6378 km
	ro	$Re / (Re + Rg)$
	PI	3.1415927
Compute:	rlat	$= PI * lat / 180$
	r lon	$= PI * lon / 180$
	rllat	$= PI * llat / 180$
	rllon	$= PI * llon / 180$
	c	$= \sin(rlat) * \sin(rllat) + \cos(rlat) * \cos(rllat) * \cos(rllon - rlon)$
	e	$= (c - ro) / \sqrt{1 - c^2}$
	E	$= 180 * \arctan(e) / PI$
Output:	If $E \geq Emin$ then estimated position is within satellite footprint, else If $E < Emin$ then estimated position is outside satellite footprint.	

Figure B.2: Algorithm to Determine if Computed Position is Inside Satellite Footprint

APPENDIX B.3 TO ANNEX B

SUGGESTED ALGORITHM FOR MESSAGE SEQUENCE TRACKING

The flowcharts in this Appendix define a procedure for the identification of missed messages through message sequence tracking. The procedure relies on the following data items or structures:

Data Item	Purpose
CurMsgNo	The current message number contained in MF #1 of the arriving message
PrvMsgNo	The previous message number contained in MF #1 of the arriving message
NextExpected	The next message number expected from a given source. This item could be represented as an array indexed by source: Next Expected [MF #2] i.e., each MCC must maintain a table of Next Expected message numbers – one such number for each reporting MCC. When a message is received, the reporting MCC in MF #2 is used to lookup the appropriate NextExpected message number from the table.
MissedMsgList	A list of messages that have been identified (by the sequence checking procedure) as overdue. MCCs may choose to implement this as a single list of MF #2: MF #1 pairs or maintain a separate list for each source.
TimeMissed	The time at which a message was declared “missing” by the message sequence tracking facility. The message would be added to the MissedMsgList at that time.
MAX_MISSING	A configuration constant that limits the number of missed messages that can be generated by a single sequence check. This minimises the impact of an MCC unilaterally resetting its message sequence generator to an arbitrary value. Set to 15.
MAX_MSGNO	A configuration constant that defines the largest message number before message number wrap around is to occur. Set to 99999.
MAX_WAIT_TIME	A configuration constant that defines the length of time the MCC will wait for an out of sequence message to arrive before a lost message is declared (and recovery action initiated). Set to 15 minutes.

The procedure is executed in two threads (parallel streams of execution):

1. message-checking thread, where each arriving message is subjected to a message sequence check; and
2. monitor thread which constantly checks the missed message list for lost messages.

The two threads are represented in separate flowcharts.

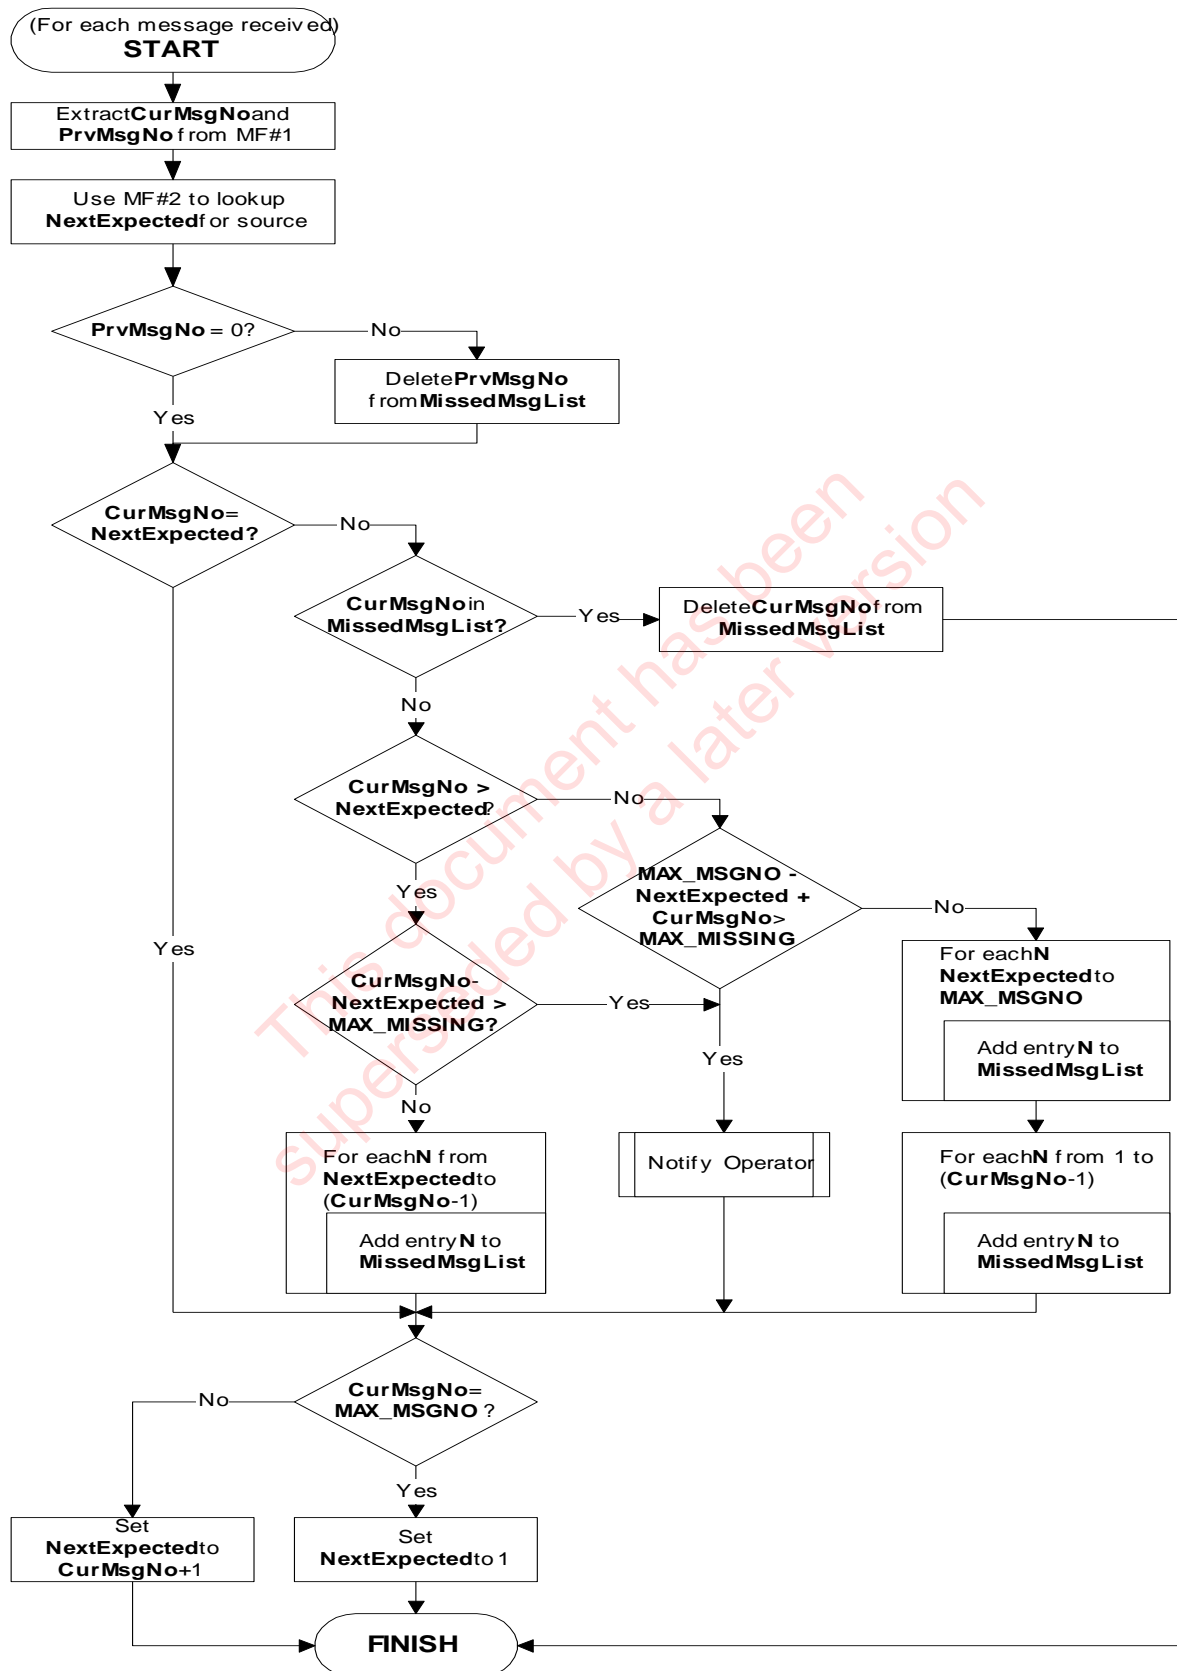

Figure B.3: Message Sequence Checking Flowchart

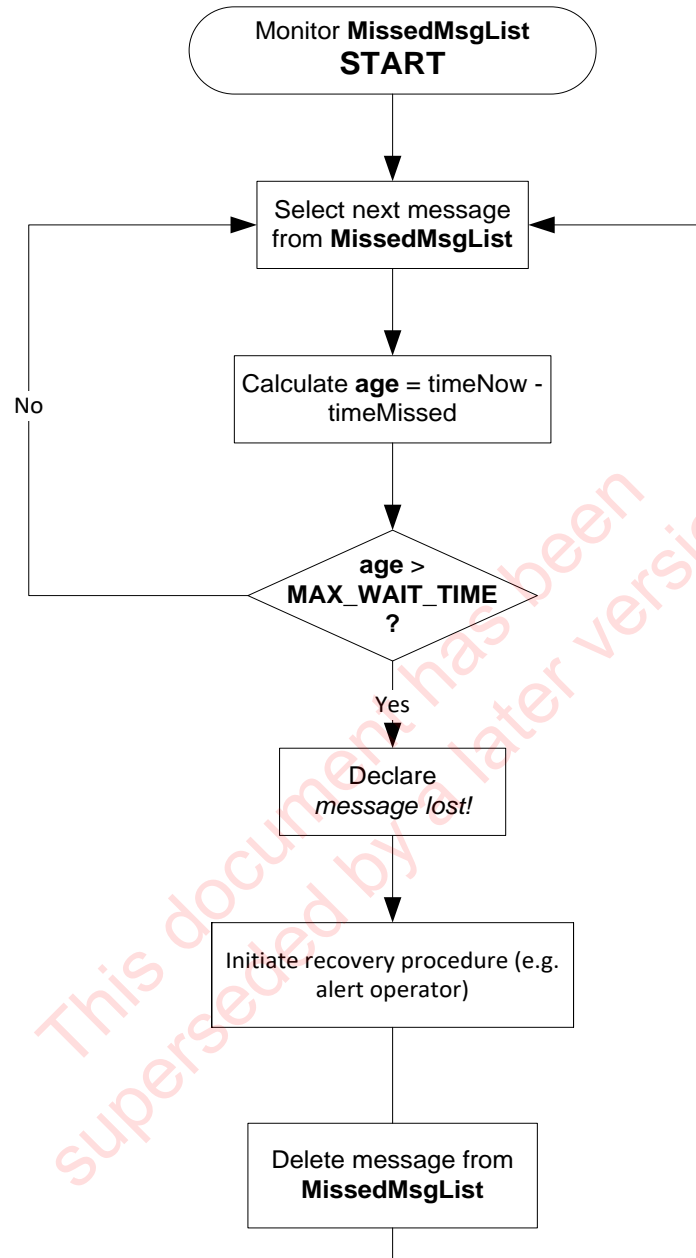

Figure B.4: Missed Message List Monitoring Flowchart

ANNEX C

MESSAGE CONTENT BY SIT

1. MESSAGE TEXT

Cospas-Sarsat messages are uniquely identified by specific Subject Indicator Types (SITs). The SIT specifies the format and category of content within the message. MCCs process messages automatically. Therefore, it is mandatory that the structure of the message formats be adhered to, so that each MCC can route and/or take action as required by the message. Tables C-1, C-2 and C-3 detail the format of the text for all messages exchanged between the MCCs in terms of Message Fields (MFs) used.

Once the SIT is known for the desired message, the corresponding column identifies which Message Field numbers (MF #) are necessary to produce the message. Annex B is then used to find the format and the produced message will be similar to those given in the appendices to this annex.

2. SAMPLE MESSAGE TEXT

For SIT messages depicted in Tables C-1, C-2 and C-3, sample messages are given in Appendix 1 to this Annex. The sample messages in Appendix 1 also indicate the message line that contains the individual MF #.

Note: The narrative text is terminated as specified in MF #41. See section 4.1 for size specification.

“A” indicates actual values, “X” indicates default values are allowed.

The underline “ ” is an indication where the New Line (NL) code is to be inserted.

MESSAGE CONTENT FOR MEOSAR DATA MESSAGES (XML)

The TOA/FOA data to be transferred between MEOLUTS is described by the Schema below in Figure C.1. This XML Schema document can be copied to an appropriate folder on a local MEOLUT data server for immediate use by any third-party XML parser. Note that each “element name” corresponds to the message field name as provided in Annex B.1 of this document or the corresponding information above in this Annex, with the explicit replacement of all spaces and other punctuation characters by the underscore characters (“_”).

Figure C.1: XML Schema for the Transfer of TOA/FOA Data Between MEOLUTs

	49	DETECTION FREQUENCY	<u>M</u>
	60	OTHER ENCODED INFORMATION	<u>O</u>
6+n	62	REMARKS	<u>M</u>
	63	END OF MESSAGE	<u>M</u>

Notes:

1. "M" means that the field is mandatory
2. "O" means that the field may be omitted if the value is NIL.
3. The underline "_" is an indication where the New Line (NL) code is to be inserted.
4. +n indicates that a variable number of lines is required to provide specified information
5. MF #48a is used for FGB other than ELT(DT)s, MF #48b is used for SGBs and FGB ELT(DT)s.
6. The "END OF MESSAGE" does not contain an associated section number.

Table C-4:
MESSAGE CONTENT FOR
SIT 985 MESSAGES

PRINTED LINE #	MF #	TITLE	
1	45	MESSAGE TYPE	<u>X</u>
2	46	CURRENT MESSAGE NUMBER	X
	47	MCC BEACON REFERENCE	<u>X</u>
3	61b	HEX ID (BEACON OPERATIONAL CHARACTERISTICS)	<u>X</u>
4	61c	TAC DATA (BEACON OPERATIONAL CHARACTERISTICS)	<u>X</u>
5+a	63	END OF MESSAGE	<u>X</u>

a = number of lines required for MF #61c

The underline "_" is an indication where the New Line (NL) code is to be inserted.

MESSAGE CONTENT FOR MESSAGES SENT TO THE LADR

The Global Aeronautical Distress and Safety System (GADSS) specifies that data is provided to the LADR via a System Wide Information Management (SWIM) compliant interface. A SWIM interface is a means through which information can be produced or consumed via a “publish/subscribe” or “request/reply” messaging pattern. ELT(DT) alert data shall be exchanged with the LADR using a SWIM compliant format known as FIXM (Flight Information Exchange Model), a standardized method to exchange Flight and Flow information in XML format. Details on FIXM can be found at www.fixm.aero.

ELT(DT) alert shall be sent to the LADR using the information provided in the following table, which links Cospas-Sarsat fields with XML field names specified for the LADR. In this table, “T” format means Modified Baudot Code. Where possible, XML data element names and structures follow the schema and definitions found at www.fixm.aero.

Table C-5:
LADR MESSAGE FIELD DESCRIPTIONS

Source C/S Message Field(s)	LADR Message Field Id Format	Remarks. Note: the Functional Requirement Designation (FRD) of the field is Mandatory, Optional or Not Present
MF #25, MF #26. MF #23, MF #77, MF #92.	Pos snn.nnnnn,snnn.nnnnn	FRD: Mandatory. Position: latitude and longitude, respectively. Per available information, the field is fixed length, including a direction sign (“+” or “-“), degrees and a 5 digit decimal field. The specific information for position, apparently required in the FIXM schema, adheres to the urn:ogc:def:crs:EPSG::4326 format. Only one position is provided per alert. SGB GNSS (i.e., encoded) position or FGB refined GNSS position is provided, if available. FGB coarse GNSS position is provided only if usable DOA position is not available for the alert. The Field is not provided if no usable position data is available.
MF #3.	messageDateTime DD/MM/YYYY/HH:MM:SS	FRD: Mandatory. Time Message Sent by the MCC to the LADR.
n/a	Date/timeofReceipt DD/MM/YYYY/HH:MM:SS	FRD: Mandatory. Time Message Received by the LADR (must be provided by the LADR).
MF #14, MF #14b.	bcnTransDateTime DD/MM/YYYY/HH:MM:SS.nn	FRD: Not Present. Beacon burst time.

Source C/S Message Field(s)	LADR Message Field Id Format	Remarks. Note: the Functional Requirement Designation (FRD) of the field is Mandatory, Optional or Not Present
MF #23 , MF #77 , MF #92 .	Ao3LD TTT	FRD: Mandatory. Three letter designator for Aircraft Operator. The Field name starts with a letter (“a”), since XML field names may not start with a number. If the current alert for an FGB ELT(DT) does not contain the Aircraft Operator then the Aircraft Operator shall be provided from a previous alert for the same beacon, if available.
n/a	aircraftRegistrationMarking TTTTTTT	FRD: One option for Particular Aircraft Id, which is Mandatory
MF #23 , MF #77 , MF #92 .	aircraftAddress TTTTTT	FRD: One option for Particular Aircraft Id, which is Mandatory. 24 bit aircraft address.
n/a	contributorCode NNN	FRD: Mandatory. TBD
n/a	dataSource AAAAA	FRD: Mandatory. Name of Sending Nodal MCC (e.g., ‘AUMCC’)
MF #61 .	positionAccuracy [TBD]	FRD: Optional. For GNSS (i.e., encoded) position, provide uncertainty per MF 61. For DOA position, provide single-burst accuracy threshold for fast-moving beacons, which is TBD.
MF #54d , MF #54e , MF #82 .	Altitude [TBD]	FRD: Optional. Altitude for the associated Latitude, Longitude described above, in metres. DOA Altitude is not provided; see description of MF #54d in “APPENDIX B.1 TO ANNEX B”. GNSS (i.e., encoded) position altitude is provided as the average of the lower and upper range values where a range of values is provided.
n/a	altitudeSource AAAA	FRD: Mandatory, if Altitude provided. “GNSS” if GNSS (i.e., encoded) position.
MF #54f .	Airspeed NNNN	FRD: Optional. Not provided unless the source MEOLUT is commissioning to provide Speed information. Airspeed is defined as the horizontal speed.

Source C/S Message Field(s)	LADR Message Field Id Format	Remarks. Note: the Functional Requirement Designation (FRD) of the field is Mandatory, Optional or Not Present
MF #22.	ELTHexId XXXXXXXXXXXXXXXXXX	FRD: Optional. 15 Hexadecimal Beacon Id
MF #58.	ADTActivationMethod AAAAAAAAAA	FRD: Optional. Beacon activation method: MANUAL, AUTOMATIC-A (if automatic by external means or avionics), AUTOMATIC-G (if automatic by beacon or G-switch).
MF #61a.	ADTCancellationMessage AAA	FRD: Optional. “YES” if confirmed cancellation.
MF #1.	messageNumber	FRD: Not Present. Sequential message assigned by the source MCC in messages sent to the LADR.

APPENDIX C.1 TO ANNEX C

SAMPLE MESSAGES

1. GENERAL

This Appendix contains examples of messages formatted for transmission. The examples are shown double spaced for ease of reading. Each example is composed of 3 sections:

- a. FORMAT FRAMES
- b. MF #
- c. CONTENT

1.1 Format Frames

The FORMAT FRAME corresponds to the required format given in section 4 of the document. The INFO frame contains the text message and can therefore be formatted as required by Cospas-Sarsat. The HEADER and TRAILER frames are specified by the host network.

1.2 MF #

This MF # provides the field number used within a particular message line and correspond to the MF # shown in Tables C-1, C-2, C-3, C-4 and C-5.

1.3 Content

This section contains the actual information transmitted. Only the content in the examples is transmitted and not the FORMAT FRAME column and the MF #s column.

1.4 SIT 185

Because of its nature, examples for SIT 185 are presented differently than examples for other SIT messages and shows only the content as it would be displayed or printed at the receiving agency.

2. SAMPLES

Sample messages for each SIT format are provided in the following pages.

**SAMPLE MESSAGE FOR

SAMPLE 406 MHz POSITION ALERT (FGB, ELT(DT))

1. DISTRESS TRACKING COSPAS-SARSAT DOA POSITION CONFLICT ALERT
2. MSG NO 21013 CMCC REF 1D1220F03BBFDFF
3. BEACON MESSAGE INFORMATION
BEACON TYPE ELT DISTRESS TRACKING
AIRCRAFT 24 BIT ADDRESS 41E077 ASSIGNED TO G BRITAIN
AIRCRAFT OPERATOR DESIGNATOR MMB
HEX ID 1D1220F03BBFDFF
COUNTRY OF BEACON REGISTRATION 232/G BRITAIN
ACTIVATION TYPE MANUAL
GNSS POSITION PROVIDED BY EXTERNAL DEVICE
4. ALERT POSITION INFORMATION
DETECTED AT 04 AUG 20 101501 UTC BY MEOSAR
ALERT LAST DETECTED AT 04 AUG 20 101501 UTC
GNSS - 01 54.40 N 045 37.53 E
UPDATE TIME WITHIN 2 - 60 SECONDS OF DETECTION TIME
ALTITUDE OF GNSS LOCATION BETWEEN 1600 AND 2200 METRES (BETWEEN 5200 AND 7200 FEET)
DOA - 02 00.1 N 046 06.2 E
5. OTHER INFORMATION
GNSS POSITION UNCERTAINTY PLUS-MINUS 2 SECONDS OF LATITUDE AND LONGITUDE
DETECTION FREQUENCY 406.0400 MHZ
POSITION CONFLICT BASED ON DISTANCE SEPARATION OF AT LEAST 20 KM
ELT(DT) POSITION DOES NOT REFERENCE ANY PREVIOUS POSITION
6. REMARKS
THIS DISTRESS TRACKING MESSAGE IS BEING SENT TO APPROPRIATE SAR AUTHORITIES
PROCESS THIS ALERT ACCORDING TO RELEVANT REQUIREMENTS
END OF MESSAGE

        </element>
      </current>
    </flight>
  </message>
</MessageCollection>
```

Notes:

- XML data element names shown in bold have been created for this sample. The actual structures are expected to be defined by the LADR vendor or ICAO. Field names start with a lower case letter per general XML convention; field “ELTHexId” is an exception to this convention.
- The location information is captured within the “pos” element, under the “point4D”, itself under the “flight” element, and throughout this section an attempt is made to follow FIXM convention and definitions, noting that it is to be determined if the “pos” element name is valid.

ANNEX D**USEFUL INFORMATION FOR

TO: MCC

REQUEST FOR ADDITIONAL INFORMATION FROM BEACON REGISTER

A. BEACON IDENTIFICATION CODE

ANNEX E

COSPAS-SARSAT STANDARD FOR THE TRANSMISSION OF SIT MESSAGES VIA FTP

1. FILE TRANSFER PROTOCOL (FTP) COMMUNICATIONS

Each ground segment facility (e.g., MCC or LUT) communicating via FTP shall comply with the applicable standards described in the Internet Engineering Task Group document RFC 959 - File Transfer Protocol, which can be found at the following web address: www.ietf.org.

File Naming Convention

A ground segment facility shall send a message by writing a file on the FTP server of the receiving facility. Each file shall contain exactly one message.

The FTP file name format shall be “?SRCE_?DEST_?CUR#.TXT”, where:

- “?SRCE” is the name of the facility that originated this message (www.cospas-sarsat.int);
- “?DEST” is the name of the facility to which this message is being sent (www.cospas-sarsat.int); and
- “?CUR#” is the Current Message Number (Message Field 1).

The FTP file name shall contain only upper-case characters. For example, a file with the name “USMCC_CMCC_02345.TXT” contains Current Message Number 02345 sent by the USMCC to the CMCC.

Any facility that wants to receive data via FTP shall provide the Host Name and/or Internet Protocol (IP) Address, User Name, Password, and Message Directory Name in Table F-1, to enable other ground segment facilities to place data on the FTP server of the receiving facility. On a bilateral basis, the receiving and sending facility should agree on passwords and other security measures. It is the responsibility of the receiving facility to provide adequate security for its FTP server.

The sending facility shall write a file with a file name extension of “.TMP” on the FTP server of the receiving facility. A file is given a temporary name to prevent the receiving facility from processing a file before it is complete. Once the file transfer is complete, the sending facility shall rename the file with an extension “.TXT”. Once the file has been renamed, the sending facility shall not manipulate the file. The receiving facility shall not process files with an extension of “.TMP”. The receiving facility shall be responsible for disposing of files placed on its FTP server.

If the receiving MCC detects an anomalous condition in the FTP file transfer, it shall notify the transmitting MCC. If an FTP file transfer fails for any reason the transmitting MCC shall try to resend the message, and notify the receiving MCC if the failure persists.

If the receiving MEOLUT detects an anomalous condition in the FTP file transfer, it shall notify

its associated MCC. If an FTP file transfer fails for any reason the transmitting MEOLUT shall maintain a 10-minute buffer of messages. Upon re-establishment of a connection the transmitting MEOLUT shall send the buffered messages. If MEOLUT FTP file transfer failures persist, the transmitting MEOLUT shall notify its associated MCC.

Each facility communicating via FTP shall operate in binary transfer mode.

2. FILE TRANSFER PROTOCOL (FTP) INFORMATION LIST

A list of information used to send messages to a facility via FTP is provided in this section. This list is composed of 6 items:

1. Receiving Ground Segment Facility,
2. Host Name,
3. IP Address,
4. User Name,
5. Password,
6. Message Directory Path.

2.1 Receiving Ground Segment Facility

The name of the ground segment facility to receive data via FTP. For an MCC, this name matches the MCC Identification Code in the Cospas-Sarsat website. For a MEOLUT, this name matches the MEOLUT name in the Cospas-Sarsat website, noting that spaces are always replaced with an underscore (“_”) character.

2.2 Host Name

This is the FTP Host Name of the receiving ground segment facility. ***

2.3 Internet Protocol (IP) Address

This is the Internet Protocol Address referenced to reach the receiving ground segment facility. ***

2.4 User Name

The User Name required to login to the FTP server of the receiving facility. If the value is “Sending Ground Segment facility Name”, then the user name is the name of the sending ground segment facility, per the Cospas-Sarsat website (www.cospas-sarsat.int). ***

2.5 Password

The password required to access the FTP server of the receiving facility. ***

“*** indicates that the information is provided on a need to know basis.”

2.6 Message Directory Path

The path of the directory into which message files shall be written. <facilityname> indicates that each facility will put messages in a sub-directory per facility, where the sub-directory name is the name of the sending facility, per the Cospas-Sarsat website, (www.cospas-sarsat.int).

3. SECURITY

All ground segment facilities with an Internet connection must be protected by firewall technology.

3.1 Passwords

Ground segment facilities shall formulate passwords using security best practices. The passwords shall have the following characteristics:

- contain at least 8 characters,
- not have any characters that are “blank”,
- six of the characters shall occur once in the password,
- at least one of the characters must be a number (0-9) or a special character (~, !, \$, #, %, *) – see Table E-1,
- at least one of the characters must be from the alphabet (upper or lower case),
- passwords shall not include:
 - words found in any dictionary (English or other language), spelled forward or backward,
 - system User Ids,
 - addresses or birthdays,
 - common character sequences (e.g., 123, ghijk, 2468),
 - vendor-supplied default passwords (e.g., SYSTEM, Password, Default, USER, Demo),
 - words that others might guess.

Ground segment facilities shall change passwords at least semi-annually.

To protect passwords from unauthorized disclosure facilities shall exchange passwords by telephone or facsimile if allowed by security authorities at each facility. Facilities shall coordinate the exchange of new passwords during the last full work week of April and October of each year. Facilities exchanging passwords shall agree on an implementation date that is not later than the end of the week during which new passwords are exchanged.

Table E-1: FTP Password Special Characters

SYMBOL	NAME

^	CHAPEAU / HAT
&	AMPERSAND
*	ASTERIX
)	CLOSE PARENTHESSES
(OPEN PARENTHESSES
`	APOSTROPHE
-	HYPHEN
“	QUOTATION
/	SLASH

3.2 Access

Access permissions on all directories and files on the FTP server shall follow the principle of “least permissions” to ensure that no unauthorized access is allowed. “Least permissions” means that each user is granted the minimum access required to perform their assigned tasks.

Facilities shall check IP addresses to limit server access only to authorized users.

Facilities shall allow access to their FTP servers only through ports 20 and 21. All other ports that are not being used shall be closed.

3.3 Anonymous FTP

Facilities shall not use anonymous FTP.

3.4 Encryption of Critical Information

Facilities shall implement methodologies to encrypt FTP login names (userids) and passwords during file transmission to prevent unauthorized disclosure. These methodologies include FTP

over Internet Virtual Private Network (VPN). Standards for the use of hardware VPN are contained in Annex F.

3.5 Monitoring for a Potential Security Breach

Facilities shall monitor the FTP servers for abnormal activity. If a breach of security is found, ground segment facilities shall notify all FTP correspondents as soon as possible to minimize exposure.

Examples of items that should be monitored on a FTP server include:

Event logs:

should be set and checked for failed login attempts,
gaps in time and date stamps,
attempts to elevate privileges;

Disk Space:

unexplained loss of disk space,
unexplained disk access;

Unexplained events:

large number of failures (system or programs crash),
unexplained process or programs running,
new users added,
virus protection has been disabled.

3.6 Security Patches

Facilities shall apply the latest software and security patches to their FTP servers as soon as possible.

ANNEX F

COSPAS-SARSAT STANDARD FOR THE TRANSMISSION OF SIT MESSAGES VIA HARDWARE VPN

1. INTRODUCTION

A Virtual Private Network (VPN) provides a secure method to transmit information over the Internet. A tunnelling technology such as Internet Protocol IPsec is used to set up private connections between separate sites. A tunnel provides a means for forwarding data across a network from one site to another, as if they were directly connected.

Prior to an MCC setup/installation an MCC installer should ensure that the IP address range selected for the MCC's network does not conflict with the IP range of all other MCCs with which it may potentially connect.

IP conflicts will not stop the creation of the VPN tunnel but will prevent the transfer of data using FTP between the hosts.

This aspect is especially relevant when a new ground segment is being installed.

2. STANDARDS

2.1 Tunnelling

MCCs that use VPN to transmit data via the Internet shall use IPsec. IPsec is a framework of open standards developed by the Internet Engineering Task Force (IETF). IPsec provides security for transmission of sensitive information over the Internet. IPsec acts at the network layer, protecting and authenticating IP packets between participating IPsec devices ("peers"), such as Cisco routers.

IPsec provides the following network security services:

- Data Confidentiality - The IPsec sender can encrypt packets before transmitting them across a network.
- Data Integrity - The IPsec receiver can authenticate packets sent by the IPsec sender to ensure that the data has not been altered during transmission.
- Data Origin Authentication - The IPsec receiver can authenticate the source of the IPsec packets sent. This service is dependent upon the data integrity service.
- Anti-Replay - The IPsec receiver can detect and reject replayed packets.

2.2 Mutual Confirmation Method

This step performs the function of a negotiator. It will allow two IPSec nodes to decide which algorithms they will use for authentication and encryption, as well as how long this session will last. The Cospas-Sarsat standard is the PreShared Key Internet Key Exchange (IKE) method.

2.3 Code Algorithm (Crypto Algorithm)

This step applies a mathematical formula to the information to be encrypted. MCCs should implement the highest level of encryption that is available on a bilateral basis. Possible choices include:

- DES,
- 3DES,
- CAST128,
- Blowfish.

2.4 Confirmation Algorithm

This step applies an algorithm that is used to validate that both ends of a session (MCCs) are in fact who they claim to be. The Cospas-Sarsat standard is the MD5 confirmation algorithm.

2.5 Perfect Forward Security

Perfect Forward Security (PFS) should be set to group 1, 2, or 3.

2.6 Lifetime

Specify lifetime at an agreed standard time (e.g., 120 minutes).

3. HARDWARE CONFIGURATION

Hardware VPN is defined as any piece of commercial or industrial-grade hardware that supports international and non-proprietary VPN standards, for example IPSec. Some possible hardware VPN devices include, but are not limited to Routers, Concentrators, VPN appliances and Firewalls, in any combination.

These devices provide the security called for in section E.3.4 of the FTP standard (Annex E).

4. CONFIGURING FTPV BETWEEN MCCS

The following two templates can be used when configuring FTPV between two MCCs. The two MCCs are shown as XXMCC and YYMCC.

The first template, Table G-1, is used for configuring the VPN concentrators at each end of the VPN.

The second column lists all parameters configured on the XXMCC VPN concentrator. The third column lists all parameters configured on the YYMCC VPN concentrator. The IKE Peer Address on the XXMCC VPN concentrator is provided by YYMCC. The IKE Peer Address on the YYMCC VPN concentrators is provided by XXMCC. All other IKE and IPSEC parameters are the same on both VPN concentrators and must be negotiated by the two MCCs.

Table F-1: Template for VPN Concentrator Parameters

FTP-VPN Configuration		
	As Configured on the XXMCC VPN Concentrator	As Configured on the YYMCC VPN Concentrator
Peer Site ID	YYMCC	XXMCC
IKE Details		
IKE Peer Address		
IKE Encryption		
IKE Authentication		
IKE Key Exchange		
IKE Pre-Shared Key		
IKE Time Lifetime		
IKE Data Lifetime		
IPSEC Details		
IPSEC Encryption		
IPSEC Authentication		
IPSEC PFS		
IPSEC Data Lifetime		
IPSEC NAT-T		
IPSEC Encapsulation Mode		
IPSEC Connection Type		

The second template, Table G-2, lists the information required by each MCC to establish a FTP connection and to transmit SIT messages. The information in the second column lists all information required by XXMCC to transmit SIT messages to YYMCC. The information in the second column is provided by YYMCC for use by XXMCC. The third column lists all information required by YYMCC to transmit SIT messages to XXMCC. The information in the third column is provided by XXMCC for use by YYMCC.

Table F-2: Template for FTP Server Logon Information

FTP Server Logon Information		
	Used by XXMCC to Log onto YYMCC FTP Server	Used by YYMCC to Log onto XXMCC FTP Server
Remote Primary FTP Address		
Remote Secondary FTP Address		
FTP Username		
FTP Password		
Incoming Directory		
Data Transfer		

Examples of the templates are shown in the Tables F-3 and F-4 that list parameters and information that could be used by AUMCC and INMCC.

Table F-3: Example of Template of VPN Concentrator Parameters

FTP-VPN Configuration		
	As Configured on the AUMCC VPN Concentrator	As Configured on the INMCC VPN Concentrator
Peer Site ID	INMCC	AUMCC
IKE Details		
IKE Peer Address	220.228.67.145	203.20.107.66
IKE Encryption	3DES-168	3DES-168
IKE Authentication	MD5/HMAC-128	MD5/HMAC-128
IKE Key Exchange	DH Group 2	DH Group 2
IKE Pre-Shared Key	***	***
IKE Time Lifetime	28800	28800
IKE Data Lifetime	10000	10000
IPSEC Details		
IPSEC Encryption	3DES-168	3DES-168
IPSEC Authentication	ESP/MD5/HMAC-128	ESP/MD5/HMAC-128
IPSEC PFS	Group 2	Group 2
IPSEC Data Lifetime	86400	86400
IPSEC NAT-T	Not Enabled	Not Enabled
IPSEC Encapsulation Mode	Tunnel	Tunnel
IPSEC Connection Type	Bi-directional	Bi-directional

Table F-4: Example of Template of FTP Server Logon Information

FTP Server Logon Information		
	Used by AUMCC to Log onto INMCC FTP Server	Used by INMCC to Log onto AUMCC FTP Server
Remote Primary FTP Address	106.104.13.110	203.119.16.99
Remote Secondary FTP Address	106.104.13.115	
FTP Username	***	***
FTP Password	***	***
Incoming Directory	.	.
Data Transfer	Binary	Binary

Note that the IKE Pre-Shared Key, FTP Username and FTP Password are shown as “***” in the above tables as the information must be kept secure. Exchange of these details must be undertaken via fax or telephone only. Other details may be transmitted by email.

– END OF ANNEX F –

ANNEX G

COSPAS-SARSAT STANDARD FOR THE TRANSMISSION OF SIT MESSAGES VIA AFTN

1. INTRODUCTION

The Aeronautical Fixed Telecommunications Network (AFTN) is a worldwide system of aeronautical fixed circuits provided, as part of the aeronautical fixed service, for the exchange of messages, and/or digital data between aeronautical fixed stations having the same or compatible communications characteristics. Communication procedures for the AFTN are detailed in Annex 10 to the Convention on International Civil Aviation, Volume II, Communication Procedures, which can be downloaded from the ICAO web site.

AFTN provides a store-and-forward messaging service for the conveyance of text messages, which supports the entire character set authorised for use in Cospas-Sarsat SIT messages.

All AFTN messages include a Transmission Identification (TI) of the form “MSO003” where the TI is comprised of the Channel Identifier (CI) = “MSO” and the Channel Sequence Number (CSN)=”003”.

Channel checks (heartbeat) are undertaken between an AFTN station and its AFTN communication centre to ensure the link is available and for synchronising of message numbers. These checks are usually undertaken every twenty minutes on the hour and will contain a unique Channel Sequence Number (CSN).

Although the AFTN communications centre ensures that messages are received correctly in terms of the “heading, address, origin and ending syntax” the system does not perform checks to validate the message text. Some MCCs have reported corruption in AFTN messages. The corruption can be quite severe and obvious to the recipient, however at other times they may be extremely difficult to detect.

The ICAO AFTN standard requires long term retention of AFTN traffic records to be maintained for 30 days. The AFTN standard for retaining messages does not obviate the MCC archiving requirement specified in document C/S A.005 (MCC specification).

2. CATEGORIES AND PRIORITIES OF MESSAGES

The AFTN supports the following categories of messages:

- a) distress messages;
- b) urgency messages;
- c) flight safety messages;
- d) meteorological messages;
- e) flight regularity messages;
- f) aeronautical information services (AIS) messages;
- g) aeronautical administrative messages; and
- h) service messages.

Each AFTN message type has an associated message priority. Section 5 provides recommendations in respect of message priorities for the various SIT message types. The highest priority used in the AFTN is SS, followed by DD.

Distress messages (priority indicator SS)

This message category comprises those messages sent by mobile stations reporting that they are threatened by grave and imminent danger and all other messages relative to the immediate assistance required by the mobile station in distress.

AFTN requires that messages transmitted with an SS priority be acknowledged using the format defined by ICAO. MCCs should ensure that SS priority messages are acknowledged by the MCC itself.

Urgency messages (priority indicator DD)

This category comprises messages concerning the safety of a ship, aircraft or other vehicles, or of some person on board or within sight.

3. AFTN MESSAGE FORMAT

The AFTN message formats for the International Telegraph Alphabet No.2 (ITA2) and International Alphabet No.5 (IA5) formats are provided in Figures 1 and 2. AFTN messages are comprised of a header, message body (SIT MESSAGE), and trailer. The SIT message is to be inserted into the fields identified as “Message Text” indicated in Figures 1 and 2.

AFTN messages cannot exceed 2100 characters in total, and the content of the SIT message inserted into an AFTN message cannot exceed 1800 characters.

3.1 AFTN Address Indicator

An AFTN address comprises 8 characters of the form:

- a) four-letter location indicator listed in ICAO document, Doc 7910, e.g., YSAR for the Australian RCC/AUMCC, Canberra;
- b) three-letter designator as listed in ICAO document, Doc 8585, e.g., ZSZ (which has been allocated for Sarsat Centre) for the French MCC and YCY for the Norwegian MCC; and
- c) an additional letter which can represent a department, division or process within the organization/function of the originator. The letter X shall be used to complete the eight-letter address when explicit identification is not required.

3.2 Multiple Address Distribution

AFTN includes a facility for distributing messages to multiple addresses. The use of this capability is not recommended for communications from an MCC since it reduces the effectiveness of message number sequence checking.

This document has been
superseded by a later version

4. EXAMPLES OF AFTN MESSAGES

The following are examples of AFTN messages using the IA5 format:

a) Example of an SS Priority AFTN Message transmitted by the UKMCC to the FMCC:

```
UKZ003                < Transmission Identification >
SS LFIAZSZX
050021 EGQPZSZX
/55325 00000/2320/04 065 0021

/+232/+52.975/-013.808/118 008.2 004.6/50/04 054 0956/3/005.2 029.8
/LASSIT
/ENDMSG
```

5. RECOMMENDED SIT MESSAGE AFTN PRIORITIES

Table 1 provides the suggested AFTN priorities for the various SIT message types. MCCs may, on a bilateral basis, use different priorities from those suggested.

Table G-1: Suggested AFTN Priority for SIT Messages

SIT Number	Type	Suggested Priority	Comments
121, 141	406 INTERFERER NOTIFICATION	DD	
122, 142 322,342	406 INCIDENT (NO DOPPLER and NO DOA)	SS	
123, 143 323, 343	406 POSITION CONFLICT (ENCODED ONLY)	SS	
124, 144 324, 344	406 CONFIRMATION (ENCODED ONLY)	SS	
125, 145 345	406 INCIDENT	SS	
126, 146 346	406 POSITION CONFLICT	SS	
127, 147 347	406 POSITION CONFIRMATION	SS	
132, 136 332, 336	406 NOTIFICATION OF COUNTRY OF REGISTRATION (ENCODED ONLY)	DD / SS	
133 & 137 337	406 NOTIFICATION OF COUNTRY OF REGISTRATION	DD / SS	
134, 138 334, 338	406 RLSP (ENCODED ONLY)	SS	
135, 139 339	406 RLSP	SS	
185	COSPAS-SARSAT DISTRESS ALERTS TO RCCs/SPOCs	DD / SS	
215	ORBIT VECTORS	DD	
415	SARP CALIBRATION	DD	
510	406 MHz SARR FREQUENCY CALIBRATION OFFSET	DD	
605	SYSTEM STATUS TO ALL MCCs	SS / DD	Operator to decide dependent upon content
915	NARRATIVE MESSAGES FOR MCCs	SS / DD	Operator to decide dependent upon content
925	406 BEACON REGISTRATION INFORMATION (15 HEX ID)	DD / SS	
926	406 BEACON REGISTRATION INFORMATION (23 HEX ID)	DD / SS	
927, 985	BEACON OPERATIONAL CHARACTERISTICS INFORMATION	DD / SS

ANNEX H

IMPLEMENTATION PLAN FOR NEW COMMUNICATION LINKS

1. IMPLEMENTATION PHASES

1.1 Phase I - Internal Development and Testing

In order to implement a new communication link, each MCC must begin with a phase of internal development and testing. This may require the procurement of communication equipment, specialized hardware, physical connections and/or other communication provider services.

The key purpose of this phase is to ensure that the new communication link is properly installed, configured and coded. Ideally, a capability should be available within the MCC environment to facilitate near “real world” testing. Completion of comprehensive development and testing is essential before proceeding to subsequent phases.

1.2 Phase II - Nodal Level Testing and Activation

Nodal MCCs operate as central entities or “hubs” in the Cospas-Sarsat Network and should be capable of handling any new communication link or protocol. There is limited benefit for an MCC within a DDR to implement a protocol that the nodal MCC does not yet support.

Nodal MCCs can in effect validate the new communication link while also establishing it at the core level of the Cospas-Sarsat System network. Lessons learned and resulting adjustments made can be passed along to other MCCs to minimize costs resulting from redundant efforts. During this phase, each nodal MCC coordinates bilaterally, first testing and then activating each link.

1.3 Phase III - DDR Level Testing and Activation

This phase provides for establishing a new communication protocol between the nodal MCC and each of the MCCs within its DDR. When this phase starts, the nodal MCC will have operational links with most other nodal MCCs, and the experience gained should facilitate efforts under Phase III.

1.4 Phase IV - System Wide Testing and Activation

This phase provides for establishing links between MCCs as well as between MCCs and - other destinations, as appropriate. The intent is to test and activate all links outside the standard nodal configuration, most importantly the connections between additional MCC pairings to support the transmission of Cospas-Sarsat narrative traffic. Communication agreements between neighbouring MCCs shall be addressed during this phase.

ANNEX I

PROTOCOL FOR THE TRANSMISSION OF SIT MESSAGES VIA ELECTRONIC MAIL (EMAIL)

1. EMAIL COMMUNICATIONS

- 1.1** Electronic mail is a store-and-forward method of composing, sending, receiving and storing messages over Internet or other networks.
- 1.2** Email is an optional means of communication that shall be adopted on a bilateral contingency basis. Email should be used during the period it takes to implement MCC backup procedures (less than 30 minutes) when AFTN and FTP-VPN have failed or are unavailable.
- 1.3** Email communication shall be organized via mail Servers announced by MCCs. In the main, these mail Servers are the ones used for general purpose unformatted communications from MCCs.
- 1.4** Mail Boxes shall be created at Mail Servers exclusively for exchange by SIT information.
- 1.5** An MCC shall create and send messages with SIT data which would be transmitted via Internet to Mail Box of the receiving MCC. The receiving MCC shall be responsible for disposing the messages received in its Mail Box to the SIT processing programs of MCC.
- 1.6** Where a front-end communications server is used for Email transmissions it shall adhere to the national Administration's Email security provisions. The following Cospas-Sarsat Email security provisions outlined in section I.3 may be used as a guide by national Administrations in addition to any government security measures.

2. MESSAGE FORMING CONVENTION

2.1 Each message shall contain exactly one SIT message. The message is formed of the following parts:

1. Receiving MCC Address (To),
2. Subject field,
3. Message Body.

2.2 Receiving MCC Address (To) is formed as Recipient-Name@Domain-Name and is received from corresponding MCC on need-to-know basis. Example: sit-reception-?777@marsat.ru

2.3 Subject field format shall include “?SRCE_?DEST_?CUR#.”, where:

- “?SRCE” is the Source MCC Name (per www.cospas-sarsat.int);
- “?DEST” is the Destination MCC Name (per www.cospas-sarsat.int); and
- “?CUR#” is the Current Message Number (Message Field 1).

The Subject field shall contain only upper case characters. For example, a file with the name “USMCC_CMCC_02345” contains Current Message Number 02345 sent by the USMCC to the CMCC.

2.4 Message Body shall be created using SIT conventions so only text mode will be used. No attachments should be included in the message.

3. SECURITY

- 3.1** To ensure security of the Cospas-Sarsat System MCCs using Email for SIT messages transmission must be protected by firewall. The computer used for email communications should be protected inside a demilitarized zone (DMZ).
- 3.2** The Software Firewall used shall be limited to highest level of security.
- 3.3** Message shall be encrypted to prevent corruption.
- 3.4** Adequate filters shall be implemented (on Email address, electronic signature, IP address, etc.). These controls shall be made before the messages are processed by MCC system.
- 3.5** The identity of the sender shall be determined via a system check or via operational coordination.
- 3.6** Initial check of message formats (SIT format, filename, etc.) shall be undertaken prior to processing of the message by the MCC. Any non-conforming message shall be rejected and an alarm raised to allow operator intervention.
- 3.7** Receipt of multiple redundant messages shall result in an alarm being raised to allow for operator intervention.
- 3.8** Routine Cospas-Sarsat message number checks shall be adopted to identify any message loss including operational checks during periods of low message traffic exchange.
- 3.9** All transmitted messages shall be archived.

- END OF ANNEX I -
