## **1. INTRODUCTION**

---

### **1.1 Overview**

The purpose of the Cospas-Sarsat System is to provide distress alert and location data for search and rescue (SAR) by using spacecraft and ground facilities to detect and locate distress signals. The computed position of the distress and other related information is transmitted to appropriate SAR authorities.

Distress beacons (Emergency Locator Transmitters - ELTs, Emergency Position Indicating Radio Beacons - EPIRBs, Personal Locator Beacons - PLBs) transmit 406 MHz signals that are detected by Cospas-Sarsat polar-orbiting or geostationary spacecraft. These signals are relayed to Cospas-Sarsat ground receiving stations termed Local User Terminals (LUTs), which process the signals to determine the beacon location. Alerts are then relayed, together with location data, via a Mission Control Centre (MCC), either to another MCC or to the appropriate search and rescue point of contact (SPOC) to initiate SAR activities.

After the February 2009 phase-out of satellite processing at 121.5/243 MHz, the only frequency currently in use is 406 MHz.

Each MCC distributes Cospas-Sarsat messages according to the System document C/S A.001 "Cospas-Sarsat Data Distribution Plan" which defines the Cospas-Sarsat ground communication network. Cospas-Sarsat messages are sent in formats which permit the data to be automatically processed and transmitted. These message formats are referenced in this document C/S A.002 "Cospas-Sarsat Mission Control Centres Standard Interface Description".

### **1.2 Document Objective**

The Cospas-Sarsat System is operated in accordance with the 1988 International Cospas-Sarsat Programme Agreement and other related documents. The purpose of this document C/S A.002 (SID) is to describe the message formats and communication standards required to transmit data between Cospas-Sarsat MCCs. It is designed to facilitate information exchange between Cospas-Sarsat MCCs and between those MCCs and Rescue Coordination Centres (RCCs) of countries without MCCs.

This document specifies the structure and content of the information portion of Cospas-Sarsat messages regardless of the communication network to be used. For an operational implementation, the information portion will of necessity be framed with the addressing, header and trailer data required by the specific network protocol.

### 1.3 Required Implementation Data

The following information must be agreed upon between two agencies establishing a communications interface:

- a. Network and protocols to be used.
- b. Data rate.
- c. Addressing/routing.
- d. Packet size constraints.
- e. Security (e.g., password, call identification and caller user data).

### 1.4 Reference Documents

- a. C/S T.001 "Specification for Cospas-Sarsat 406 MHz Distress Beacons".
- b. C/S A.001 "Cospas-Sarsat Data Distribution Plan".

### 1.5 Document Amendments and Updates

- a. Amendments of message formats which affect all MCCs require recommendation for change by the Joint Committee (JC) and approval by the Cospas-Sarsat Council (CSC).
- b. Formats and content of any messages which are exchanged between two MCCs on a bilateral basis only, may be amended by mutual agreement. Written notification of changes will be provided to the Cospas-Sarsat Secretariat for document control and formal amendment.
- c. If any two MCCs find the need to introduce a new message format which is strictly used bilaterally, details will be submitted to the Cospas-Sarsat Secretariat who will assign a Subject Indicator Type (SIT) code to the message and publish the relevant amendment.

- END OF SECTION 1 -

## **2. COMMUNICATION CHANNEL INTERFACES**

---

Two types of communications are required among the Cospas-Sarsat MCCs. Voice communication is required for general coordination and follow-up/confirmation of certain automated message transmissions. Data communication using formatted messages are required for the transfer of Cospas-Sarsat alert data and System information.

### **2.1 Voice Communication Facilities**

Voice communications are made over the public dial-up telephone network or other available networks. Voice communication will not be discussed further in this document.

### **2.2 Data Communication Facilities**

All text and data transmissions between MCCs, including alert messages and System information messages, shall be made in character text format only. The information transmitted in character format shall be sent in accordance with Table 4.3. Each respective MCC is responsible for:

- a. making the necessary provisions for connecting to the appropriate communication networks; and
- b. implementing MCC to MCC communications on the selected communication networks in accordance with the standards described in the Annexes to this document.

Participating countries may bilaterally choose to implement primary and alternate communications systems.

#### **2.2.1 Cospas-Sarsat Message Text**

All Cospas-Sarsat messages contain specified types of information. Each one of these information types, called a Message Field (MF), is described in greater detail in Annex B. These message fields are then grouped as shown in Annex C to produce the messages for the various Subject Indicator Types (SITs) listed in Annex A.

Originators of operational messages should endeavor to provide actual values in all fields indicated by the letter "A" in Tables C-1 and C-2. Fields indicated by the letter "X" must not be omitted, but may use default values if actual data is not available.

### **2.2.2 Subject Indicator Types (SITs)**

The types of messages that are exchanged between the MCCs are listed in Annex A. Each type of message is identified by a SIT. The SIT is used to facilitate automatic message handling. Annex A lists the SIT code numbers and their assigned use. Annex C defines the content of each of the SIT messages.

### **2.2.3 Character Text**

This specification is based on a text format using International Alphabet No.5 representation. To provide for use on networks using the International Telegraph Alphabet No.2 (ITA2) characters, a table of equivalence between the International Alphabet No.5 character representation and ITA2 is provided in Table 4.3.

- END OF SECTION 2 -

This document has been superseded  
by a latest version

### **3. COMMUNICATION STANDARDS**

---

The message formats presented in this document provide flexibility, efficiency, and compatibility among MCCs. They are independent of the communication network and protocol employed.

All MCC messages are formed as a series of octets (one octet is 8 bits, or one byte). A message may be made up of any number of octets, subject to the restriction in section 4.

The communication networks accepted for MCC to MCC communications are introduced below and the standards to which each MCC must adhere for their use in the Cospas-Sarsat Ground Segment are described in the Annexes to this document. Some of these networks provide an error detection and/or error correction capability for detecting and correcting data errors introduced by the communications system.

It is the responsibility of the MCC accepting data to implement adequate security and to co-ordinate security measures with other MCCs from whom it will receive data. All MCCs with an Internet connection must be protected by firewall technology.

#### **3.1 X.25 Communications**

The X.25 protocol provides an inherent error detection and correction capability required for reliable communications between Cospas-Sarsat MCCs. Guidance for using X.25 for MCC to MCC communications is provided at Annex E to this document.

While the X.25 network allows MCCs to establish real-time data links, the CCITT recommendations themselves do not specify how messages should be exchanged over these links. Therefore, Annex E provides the Cospas-Sarsat standards for exchanging data between MCCs. In addition to Annex E, MCCs are expected to follow the recommendations of the CCITT which can be found in the publication "CCITT Blue Book, (Volume VIII – Fascicle VIII.2) Data Communication Networks: Services and Facilities, Interfaces Recommendations X.1-X.32.

Due to the fact that X.25 services are being terminated in many countries and because of increasing user costs, X.25 is being phased-out for MCC to MCC communications.

#### **3.2 File Transfer Protocol (FTP) Communications**

FTP is an Internet based protocol that can be used to exchange messages between Cospas-Sarsat MCCs. It is highly reliable due to its inherent error detection and correction capability. Each MCC communicating via FTP shall comply with the applicable standards described in the Internet Engineering Task Group document RFC 959 - File Transfer

Protocol. In addition, MCCs communicating via FTP shall comply with the Cospas-Sarsat standards contained in Annex F.

All FTP servers used for the exchange of SIT messages should be linked exclusively using Internet VPNs that meet the Cospas-Sarsat standard provided at Annex G.

### **3.3 AFTN/AMHS Communications**

The aeronautical fixed telecommunications network (AFTN) is a worldwide system that provides point-to-point communications for text messages. Access to the AFTN network is restricted to terminals that are operated in controlled locations, such as Air Traffic Control Centres and MCCs. The network operates at fairly low data rates (i.e. 300 or 9600 baud). Communications procedures for the AFTN are controlled by ICAO and are detailed in Annex 10 to the Convention on International Civil Aviation, Volume II, Communication Procedures. Guidance for using AFTN for MCC to MCC communications is provided at Annex H to this document.

AFTN is being upgraded by ICAO to the Aeronautical Message Handling System (AMHS). The transition from AFTN to AMHS will be implemented gradually to meet the requirements of Administrations. This transition is expected to enhance communication services in several regions of the world and should not negatively impact the use of AFTN communications by Cospas-Sarsat.

- END OF SECTION 3 -

*This document has been superseded by a latest version*

## 4. MESSAGE FORMAT

### 4.1 Format Requirements

All Cospas-Sarsat messages shall be framed as shown in Figure 4.1. The structure of the frames is specified by the host network and does not impact the Cospas-Sarsat information transmitted.

For the entire message, including the required network framing, the number of characters on any one line shall not exceed 69. This does not include the New Line (NL) sequence described below.

Each line shall end with a new line (NL) sequence that is defined as CRCRLF or CRLF where

CR means Carriage Return - Hex 0D (i.e. zero D)

LF means Line Feed - Hex 0A (i.e. zero A)

The entire message including any network required framing shall not exceed 25,000 characters.

However, message originators may need to further limit message size depending on specific network constraints.

Format Frame	Contents
HEADER (network dependent)	Made available to satisfy the host network requirements if any.  These contents must be designed into the application software of the agency using the network.
INFORMATION (SIT message)	Cospas-Sarsat message text as defined in this document, irrespective of the network in use.
TRAILER (network dependent)	As per HEADER above.

**Figure 4.1: General Message Structure**

Since some communication networks may add a Header that precedes the SIT message, MCCs must be able to identify the beginning of a SIT message. The presence of SIT Message Fields 1 - 3 shall be used to identify the beginning of a SIT message. That is, Message Fields 1 - 3 shall have the format “/nnnnn nnnnn/nnnn/nnn nn nnnn”, where n is a numeral between 0 - 9.

## 4.2 Character Set

The set of International Alphabet No.5 characters that have an equivalent ITA2 character is the set of allowable characters for the INFORMATION frame of Figure 4.1.

To ensure compatibility, Tables 4.1, 4.2 and 4.3 provide details of those characters. Table 4.1 defines the International Alphabet No.5 characters while Table 4.2 illustrates ITA2 characters. Table 4.3 details the conversions between the two character sets.

Characters not found in Table 4.3 are not permitted.

The octothorpe (#) character shall not be used in the information frame of Cospas-Sarsat messages as it is a command character for some networks.

**ANNEXES  
TO  
COSPAS-SARSAT  
MISSION CONTROL CENTRES  
STANDARD INTERFACE  
DESCRIPTION**

---

This document has been superseded  
by a latest version

**ANNEX A****SUBJECT INDICATOR TYPES (SITs)****1. GENERAL**

---

All Cospas-Sarsat messages are identified by a Subject Indicator Type (SIT) number according to the subject matter being transmitted.

Descriptions of the Subject Indicator Types are included in Tables A.1 and A.2.

**2. SIT BLOCK ASSIGNMENT**

---

To maintain uniqueness between the SIT numbers for all Cospas-Sarsat agencies, Table A.3 subdivides the range of possible numbers, from 000 to 999 by subject and application.

The proper application of this table will ensure standardization in numbers and usage to facilitate automatic message handling by the MCCs.

This document has been superseded  
by a latest version

**TABLE A.1****Subject Indicator Types for Alert Messages**

<b>SIT</b>		<b>Meaning</b>	<b>Page</b>
<b>121</b>	406 INTERFERER NOTIFICATION	This message is used for notification of 406 MHz interferer signals.	C-8
<b>122</b>	406 INCIDENT (NO DOPPLER)	A 406 MHz alert message with no Doppler positions. An encoded position may or may not be available.	C-9
<b>123</b>	406 POSITION CONFLICT (ENCODED ONLY)	A 406 MHz alert message with no Doppler positions for which the encoded position differs by more than the match criteria from all previous positions.	C-9
<b>124</b>	406 AMBIGUITY RESOLUTION (ENCODED ONLY)	A 406 MHz alert message with no Doppler positions that identifies the resolved position of a 406 MHz alert.	C-9
<b>125</b>	406 INCIDENT	A beacon alert message computed from 406 MHz incident data. The message contains Doppler positions.	C-10 & C-35
<b>126</b>	406 POSITION CONFLICT	A beacon alert message computed from 406 MHz incident data. The message contains Doppler and/or encoded position(s) which may differ from previous position(s) by the match criteria.	C-10
<b>127</b>	406 AMBIGUITY RESOLUTION	A 406 MHz alert message with Doppler positions that identifies the resolved position of a 406 MHz alert. It may or may not contain an encoded position.	C-10
<b>132</b>	406 NOTIFICATION OF COUNTRY OF REGISTRATION (ENCODED ONLY)	This message is used between MCCs to notify the country of registration of a 406 MHz beacon (NOCR). This message contains only an encoded position.	C-9
<b>133</b>	406 NOTIFICATION OF COUNTRY OF REGISTRATION	This message is used between MCCs to notify the country of registration of a 406 MHz beacon (NOCR). This message contains Doppler positions. It may or may not contain an encoded position.	C-10
<b>185</b>	COSPAS-SARSAT ALERTS	This message is used for alert messages and as NOCR message between MCCs and SPOCs.	C-11 to C-22

**TABLE A.2****Subject Indicator Types for System Information and Narrative Messages**

<b>SIT</b>		<b>Meaning</b>	<b>Page</b>
<b>215</b>	ORBIT VECTORS	Sarsat or Cospas spacecraft orbit position and time message.	C-23
<b>216</b>	ORBIT VECTORS	Sarsat or Cospas spacecraft orbit position and time message. Used in special conditions (e.g., after a satellite manoeuvre) when it is required that orbit vectors at the MCC and its associated LUTs be initialized. See C/S A.001, section 3.7.5.	C-23
<b>415</b>	SARP CALIBRATION	Time and frequency calibration for a SARP.	C-24
<b>416</b>	SARP TELEMETRY	SARP telemetry from a Sarsat spacecraft.	C-25
<b>417</b>	SARP-3 CALIBRATION	Time and frequency calibration for a SARP-3.	C-26
<b>425</b>	SARP OUT OF LIMIT	Warning message to indicate abnormal performance of the SARP.	C-25
<b>435</b>	SARP COMMAND	Command request for the SARP.	C-27
<b>445</b>	SARP COMMAND VERIFICATION	Verification of the execution (or non-execution) of a SARP command as requested by command message.	C-25
<b>510</b>	406 MHz SARR FREQUENCY CALIBRATION OFFSET	Offset between actual and 406 MHz SARR-provided beacon frequencies.	C-28
<b>515</b>	SARR TELEMETRY	SARR telemetry from a Sarsat spacecraft.	C-25
<b>525</b>	SARR OUT OF LIMIT	Warning message to indicate abnormal performance of the SARR.	C-25
<b>535</b>	SARR COMMAND	Command request for the SARR.	C-27
<b>545</b>	SARR COMMAND VERIFICATION	Verification of the execution (or non-execution) of a SARR command as requested by a SARR COMMAND message.	C-25
<b>605</b>	SYSTEM STATUS TO ALL MCCs	Narrative message transmitted to all MCCs to indicate changes in System status. System status messages include System element and System function failures, scheduled maintenance, integration or testing of new System elements, and the commissioning of new equipment or new capabilities of existing equipment.	C-25 & C-29 to C-33
<b>721 and 722</b>	Reserved for MEOSAR		
<b>915</b>	FOR MCC INFORMATION TRANSMISSION TO A SINGLE MCC	Narrative message for MCC to MCC operator. This is a free format message, except when a specific format is defined (Note 1).	C-25
<b>925</b>	406 BEACON REGISTRATION INFORMATION	This message is used between MCCs to provide 406 MHz beacon registration information.	C-34

**Note 1:** Free format applies only to the message text. The complete message must still be formatted as per the host communication networks procedures.

**TABLE A.3**  
**SIT Number Assignment**

Subject Matter	Between Cospas-Sarsat MCCs	Internally by each Cospas-Sarsat Participant	Between Cospas-Sarsat MCCs and non Cospas-Sarsat Agencies	Future Growth
				000 - 099
<b>INCIDENTS</b>	100 - 149	150 - 179	180 - 199	
<b>ORBIT</b>	200 - 249	250 - 279	280 - 299	
				300 - 399
<b>SARP</b>	400 - 449	450 - 479	480 - 499	
<b>SARR</b>	500 - 549	550 - 579	580 - 599	
<b>STATUS</b>	600 - 649	650 - 679	680 - 699	
<b>LUT</b>	700 - 749	750 - 779	780 - 799	
				800 - 899
<b>NARRATIVE</b>	900 - 949	950 - 979	980 - 999	

Note: SIT for new messages other than those used internally by each Cospas-Sarsat participant must be coordinated with all Cospas-Sarsat MCCs before being placed in use.

- END OF ANNEX A -

## **ANNEX B**

### **MESSAGE FIELDS DESCRIPTION**

#### **1. GENERAL**

---

All Cospas-Sarsat messages can be divided into a series of fields, each field containing unique information. Each Message Fields (MF) is described in this Annex in terms of possible characters and range of numbers.

All fields must be present when required for a specific SIT message; no positional field can be omitted from a SIT message.

Message formats and examples by SIT numbers are given in Annex C.

#### **2. MESSAGE FIELD LIST**

---

A detailed description of each Message Field is given in this Annex. Once it is known which MFs form a particular SIT, their corresponding formats are concatenated to form the information frame of the message.

This list is composed of four columns;

- a. Message Field Number (MF#)
- b. Message Field Name (Name)
- c. Content
- d. Character Text

##### **2.1 MF#**

The numbers in this column are for simplicity of reference in Annex C.

##### **2.2 Name**

This column contains the name of the message field.

##### **2.3 Content**

This column contains the value ranges and meanings of the numbers of each MF.

The listed default values are inserted in the field only when the MCC has no proper value to insert.

##### **2.4 Character Text**

This column contains the format for each MF. Note that for MF#1 to MF#44, fields are separated by a "/" inserted at the beginning of the field, while the elements within a field are separated by a space (indicated as "b"). For MF#45 to MF#63 all required "/" and spaces (b) are indicated where they are needed. Refer to the notes at the end of the list for more information.

**TABLE B.1**  
**Message Fields Description**

MF#	NAME	CONTENT	CHARACTER TEXT	(Note 1)
1	MESSAGE NUMBER	CURRENT MESSAGE ORIGINAL MESSAGE RANGES = 00001 -> 99999	nnnnn nnnnn	(Note 2)
2	REPORTING MCC	(SEE TABLE II/A.1 in C/S A.001)	nnnn	
3	MESSAGE TRANSMIT TIME	YEAR = 00 -> 99 DAY (JULIAN) = 001-> 366 UTC - HRS = 00 -> 23 MINS = 00 -> 59	nn nnn nnnn	
4	SIT	(SEE TABLE A.1 & A.2) RANGE = 000 -> 999	nnn

7	ORBIT NUMBER	RANGE = 00001 -> 99999	nnnnn	
8	NUMBER OF ALERTS WITH DOPPLER POSITIONS	01 -> 99	nn	(Note 3)
9	NOT USED	(previously Number of Images Reported)		
10	NUMBER OF ALERTS WITHOUT DOPPLER POSITIONS	01 -> 99	nn	(Note 3)

Note 1: The following legend applies:  
all upper case = the actual transmitted character  
a = all transmittable characters  
h = Hexadecimal characters (0-9, A-F)  
s = sign symbol, plus (+) or minus (-)  
n = numerals 0 to 9  
b = space.

Note 2: If the outgoing message is not a retransmission, "00000" will be inserted as the original message number.

Note 3: Ensure the 25,000 character transmission limit is not exceeded.

**APPENDIX B.1 TO ANNEX B****MESSAGE FIELDS DEFINITION****MF Message Fields Definition**  
**#**

---

**1. Message Number**

If the outgoing message is a retransmission of a previous message, the current message number will be followed by the message number of the original message.

For message accountability it is recommended that the outgoing message number be unique and sequential for each destination. See Appendix B.3 for a suggested algorithm for message sequence tracking.

**2. Reporting MCC**

The identification code corresponding to the MCC sending the current message.

**3. Message Transmit Time**

The time at which the current message is placed on the communication channel by the reporting agency.

**4. SIT**

The Subject Indicator Type corresponding to the format required for the message being sent.

**5. Destination MCC**

The identification code corresponding to the destination of the SIT message. For the SIT 915 and 925 messages this is the final destination of the SIT message, for all other SIT messages this is the MCC receiving the current message.

**6. Spacecraft ID**

The satellite identification to which the message data applies.

**7. Orbit Number**

The orbit number of the spacecraft designated in MF#6.

**8. Number of Alerts with Doppler Positions**

The number of alerts of this SIT format with Doppler positions, that are included between the SIT header and the SIT trailer as specified in Table C.1. 406 MHz alerts may or may not contain encoded position information.

**9. Not Used (previously: Number of Images Reported)**

**10. Number of Alerts without Doppler Position**

The number of alerts of this SIT format without Doppler positions, that are included between the SIT header and the SIT trailer as specified in Table C.1.

**11. Source ID**

The identification code corresponding to the MCC / LUT that originally provided the solution data being reported on in the SIT message.

**12. Local/Global Flag**

Indicates if the reported Doppler location has been obtained from the local mode or from the global mode of operation. If the Doppler location is a mixture of global and real time data and the time of the first data point is before the AOS of the LUT, the flag is set as GLOBAL.

**Processing Channel**

The processing channel used to produce a solution. 406 SARP solutions only use data bursts processed through the SARP channel on-board the satellite. 406 SARR solutions only use data bursts relayed through the repeater on-board the satellite. 406 COMBINED SARP and SARR are solutions where the data bursts or the solutions are combined at the LUT.

406 MHz combined LEO/GEO solutions contain Doppler locations that have been produced by LEO/GEO processing.

The value for this field shall be computed from the 'A' solution.

**13. Bias**

The frequency offset of the detected signal around the frequency of 406.025000 MHz.

For GEOSAR alerts bias is given for the last detected burst.

**BSDEV**

The standard deviation of the bias measurement.

For GEOSAR alerts BSDEV is the absolute value of the difference between the first and last detected bursts.

A standard deviation of the bias measurement greater than 999 will be limited to 900.0.

**Drift**

The rate of frequency change of the beacon carrier frequency with time.

A drift rate greater than +/- 99.00 will be limited to +/- 99.00.

For GEOSAR alerts drift is the average frequency drift between the first and last detected burst ('+' if frequency increases versus time).

The value for this field shall be computed from the 'A' solution.

**14. TCA**

For LEOSAR Doppler location data, the Time of Closest Approach (TCA) indicates the time at which the satellite was closest to the beacon. For LEOSAR alerts, the value for this field shall be computed from the 'A' solution. For LEOSAR detect only solutions, the TCA is the time of the last data point.

For the first GEOSAR alert message, the TCA field contains the time of the first beacon burst of the first integration process. For the second and subsequent Beacon Message updates, the TCA field contains the time of the first burst of the current integration process.

**15. Window Factor**

The Window Factor is an indicator of the position of the data points relative to the TCA.

If the TCA is included in the set of data points, then the Window Factor is set to "0". If the TCA is not included in the set of data points, then the Window Factor has a range between "1" and "9". All values greater than "9" are set to "9".

The value for this field shall be computed from the 'A' solution.

**16. Number of Iterations**

The number of times the LUT computer had to process the detected incident data to arrive at the solution being reported on.

If the number of iterations is greater than 9, it shall be reported as a value of 9.

The value for this field shall be computed from the 'A' solution.

**17. CTA**

The Cross Track Angle (CTA) is the angle at the centre of the earth, between the satellite and the beacon at TCA.

The value for this field shall be computed from the 'A' solution.

**18. Secondary Source ID (previously: Power Indicator)**

For 406 MHz combined LEO/GEO data, the identification code corresponding to the GEOLUT that originally provided the GEOSAR data for combined processing.

The default value for this field is "0000".

**19. Number of Sidebands**

The number of identified sideband components around the solution curve that have been removed (filtered out) by the LUT/MCC.

**20. Sweep Period**

N/A for 406 MHz interferers. Use the default value (0000) as required.

(Previously the time taken by the amplitude modulation (AM) of the 121.5/243 MHz beacon signal to change from the higher to the lower AM frequency limit.)

**SPSDEV**

N/A for 406 MHz interferers. Use the default value (99) as required.

(Previously the Sweep Period Standard Deviation, defined as the measured standard deviation of the sweep period for the solution being reported, computed from the 'A' solution.)

**21. Number of Points**

For data originating from the LEOSAR system: The number of bursts detected by the LEOLUT for each beacon identification, used to develop a solution. For combined SARP and SARR, it is the number of unique time-frequency data points after the two processes have been merged.

For data originating from the GEOSAR system: The number of independent integrations performed to produce a Beacon Message as described in document C/S T.009. For unconfirmed messages, the number of points shall be set to "1". For confirmed messages the number of independent integrations shall be reported.

For combined LEO/GEO processing, it is the number of data points used from the LEOSAR channel in the combined processing.

The value for this field shall be computed from the 'A' solution.

**22. Beacon ID**

Bits 26-85 of the Beacon Message, shown in 15 character hexadecimal representation. For location protocol beacons, the bits are defaulted according to document C/S T.001.

**23. Beacon Message**

The 406 MHz binary message of the solution, in its undecoded form, shown in the full 30 hexadecimal character representation. Short format messages are left justified and zero-filled.

**24. DDR/Service Area**

The MCC country code for the individual MCC service area or the MCC country code of the nodal MCC for the DDR as provided in System document C/S A.001 "Cospas-Sarsat Data Distribution Plan".

Nodal MCCs will fill this field with service area.

**Ambiguity Resolution Flag**

Indicates which position has been determined to be the resolved (unambiguous) or image position.

For ambiguity resolution messages, the ambiguity resolution flag indicates the resolved position. A “+” indicates the resolved position in this solution. A “-” in both the “A” and “B” solution indicates that the resolved position is the encoded position contained in the Beacon Message.

For messages prior to ambiguity resolution, a “-” indicates that this position is an image, as determined by the “406 MHz LEOSAR Image Position Determination” algorithm in Appendix B.2 to Annex B. Determining that a position is an image prior to ambiguity resolution is optional.

**25. Latitude**

The calculated latitude of the solution.

**26. Longitude**

The calculated longitude of the solution.

**27. Error Ellipse**

An ellipse centred at latitude (MF#25) and longitude (MF#26) and containing the true location with a 50% probability.

**Angle**

The orientation to true north of the major axis of the error ellipse, in a clockwise direction.

**Major Axis**

The half length, in kilometres, of the major axis of the ellipse.

Any half length axis value greater than 999.9 kilometres will be limited to 999.9.

**Minor Axis**

The half length, in kilometres, of the minor axis of the ellipse.

Any half length axis value greater than 999.9 kilometres will be limited to 999.9.

**28. Probability**

The probability that the location reported in the SIT message is the actual solution and not the image solution.

**29. Next Time of Visibility**

The predicted time (predicted Loss of Signal - LOS) at which the next beacon event (in local mode) for the position being reported will occur. This time is provided by the originating MCC or a nodal MCC (only if an earlier time is available at the node). The default value of zeros shall be used when the next time of visibility is not calculated.

**30. Confidence Factor**

An indication of the accuracy of the calculated solution based on a correlation between a variety of parameters.

<b>Confidence Factor No.</b>	<b>Meaning</b>
4	Within 5.0 nautical miles
3	Within 20.0 nautical miles
2	Within 50.0 nautical miles
1	Less accurate than the above

**31. Data Residual****SDEV**

The standard deviation of the actual data points to the solution Doppler curve.

A small number is desirable.

**TREND**

The standard deviation on the time shifted solution Doppler curve.

It is an indication of the curve dispersion and a number higher than SDEV is desirable.

**32. Number of Orbit Vectors**

The number of orbit vectors (MF#s 34, 35 and 36) that are being transmitted in the SIT message.

**33. Number of Procedure Names**

The number of SARR or SARP commands that are being transmitted in the SIT message.

**34. Orbit Time**

The time at which the position (MF#35) and the velocity (MF#36) vectors of the satellite are valid.

**35. Orbit Position**

The position of the satellite in relation to the centre of the earth in X, Y and Z co-ordinate, in effect at the time specified by MF#34.

**36. Orbit Velocity**

Velocity of the spacecraft relative to the earth-fixed co-ordinate system shown for MF#35, expressed in that same co-ordinate system.

**37. Calibration Time**

The time at which the Ultra-Stable Oscillator (USO) time reference on Sarsat was rolled over as per MF#38.

**38. USO Frequency**

The oscillator frequency that was measured at the time specified in MF#37.

**39. Command Procedure Name**

The name of the commands to be executed at the time specified by MF#40 for both SARR and SARP command messages.

**Priority**

The indication of urgency for the execution of the spacecraft command procedure.

**40. Execute Time**

The time at which the command procedure name specified in MF#39 is to be executed.

**41. Narrative Text**

The character text to be transmitted as part of SIT message. Always terminated by 2 Carriage Returns, 1 Line Feed, 4 Qs, 2 Carriage Returns and 1 Line Feed. In SIT 605, 915 and 925 messages, the originating MCC shall identify itself and the final destination MCC(s) in plain text; in SIT 605 messages, the final destination is "ALL MCCs".

**42. ENDSIT**

This field always contains the code LASSIT at the end of every SIT message.

**43. ENDMSG**

This field is inserted at the end of every current message to be transmitted. It will always follow the ENDSIT field (MF#42) LASSIT.

**44. Number of Spacecraft**

The number of spacecraft for which orbit vectors are being transmitted in the SIT message.

**45. Message Type**

For a ship security alert, the message type begins with "SHIP SECURITY COSPAS-SARSAT ...", otherwise, the message type begins with "DISTRESS COSPAS-SARSAT ...".

Indicates type of alert message, for example:

- DISTRESS COSPAS-SARSAT POSITION RESOLVED ALERT
- DISTRESS COSPAS-SARSAT POSITION RESOLVED UPDATE ALERT
- DISTRESS COSPAS-SARSAT POSITION CONFLICT ALERT
- DISTRESS COSPAS-SARSAT INITIAL ALERT
- DISTRESS COSPAS-SARSAT UNRESOLVED DOPPLER POSITION MATCH
- DISTRESS COSPAS-SARSAT NOTIFICATION OF COUNTRY OF BEACON REGISTRATION ALERT
- SHIP SECURITY COSPAS-SARSAT POSITION RESOLVED ALERT

- SHIP SECURITY COSPAS-SARSAT POSITION RESOLVED UPDATE ALERT
- SHIP SECURITY COSPAS-SARSAT POSITION CONFLICT ALERT
- SHIP SECURITY COSPAS-SARSAT INITIAL ALERT

**46. Current Message Number**

The message number assigned to this message by the transmitting MCC.

**47. MCC Reference**

This reference is a unique designator supplied by the MCC to identify all messages sent for that beacon.

**48. Detection Time & Spacecraft ID**

The detection time is TCA (as defined at MF#14) and abbreviation for months is as per table below. The time is followed on the same line by the identity of the satellite which provided the alert data.

Abbreviation	Month	Abbreviation	Month
JAN	January	JUL	July
FEB	February	AUG	August
MAR	March	SEP	September
APR	April	OCT	October
MAY	May	NOV	November
JUN	June	DEC	December

**49. Detection Frequency**

Actual values will be used when available. If actual values are not available, then the value 406 MHz will be used.

**50. Country of Beacon Registration**

Three numeric characters of the Country Code followed by the ten character abbreviation of the country where the detected beacon is registered as defined in System document C/S A.001 "Cospas-Sarsat Data Distribution Plan".

Enter "NIL" if the Beacon Message is invalid per C/S A.001, section III/B.1.1.3.

**51. User Class of Beacon**

User class information as per table below and produced from beacon information by the MCC.

Enter "NIL" if the Beacon Message is invalid per C/S A.001, section III/B.1.1.3.

<b>Beacon Protocol</b>	<b>User Class in RCC Message</b>
Standard Location Protocol Aviation	STANDARD LOCATION - followed by ELT - AIRCRAFT SERIAL NO: CSTA CERTIFICATE NO ELT - AIRCRAFT 24-BIT ADDRESS 6 HEX CHARACTERS: ELT - AIRCRAFT OPERATOR DESIGNATOR OPERATOR: SERIAL NO: EPIRB - SERIAL NO: CSTA CERTIFICATE NO EPIRB - MMSI LAST 6 DIGITS: PLB - SERIAL NO: CSTA CERTIFICATE NO: SHIP SECURITY - MMSI LAST 6 DIGITS:
Maritime	
Personal Locator Beacon Ship Security	
National Location Protocol Aviation	NATIONAL LOCATION - followed by ELT - SERIAL NO: EPIRB - SERIAL NO: PLB - SERIAL NO:

(b) Maritime (Float-Free)	EPIRB (FLOAT FREE) SERIAL NO: (CSTA CERTIFICATE NO:)
(c) Maritime (Non Float-Free)	EPIRB (NON FLOAT FREE) SERIAL NO: (CSTA CERTIFICATE NO:)
(d) Personal Locator Beacon	PLB SERIAL NO: (CSTA CERTIFICATE NO:)
(e) Aircraft 24-Bit Address	ELT - AIRCRAFT 24-BIT ADDRESS 6 HEX CHARACTERS: (CSTA CERTIFICATE NO:)
(f) Aircraft Operator Designator	ELT - AIRCRAFT OPERATOR DESIGNATOR OPERATOR: SERIAL NO: (CSTA CERTIFICATE NO:)
(g) Not assigned	UNKNOWN
Spare	UNKNOWN
Test	TEST

## 52. Identification

The identification information as described in the Cospas-Sarsat beacon specifications.

Enter "NIL" if the Beacon Message is invalid per C/S A.001, section III/B.1.1.3.

**53. Emergency Code**

The emergency code as indicated by the beacon coding as described in the Cospas-Sarsat beacon specification.

Enter "NIL" if the Beacon Message is invalid per C/S A.001 section III/B.1.1.3.

**54. Position Information**

The position information associated with the resolved position, A&B Doppler positions, and the encoded position as appropriate.

**54a. Resolved Position**

Latitude and longitude of resolved position.

**54b. A Position & Probability**

The latitude and longitude of the A Doppler Position and the percentage probability that the A Position is the actual position of the incident.

**54c. B Position & Probability**

Same as MF#54b above but for B Position.

**54d. Encoded Position and Time of Update**

Latitude and longitude of encoded position. Time of update is UNKNOWN.

Enter "NIL" if the Beacon Message is invalid per C/S A.001, section III/B.1.1.3.

**55. Source of Encoded Position Data**

This indicates whether the encoded position data was provided to the beacon by an internal or external device. Enter "NIL" if the Beacon Message is invalid per C/S A.001, section III/B.1.1.3.

**56. Next Pass Times**

The predicted time (predicted Loss of Signal – LOS) at which the next beacon event (in local mode) for the position being reported will occur.

**56a. Next Time of Visibility of Resolved Position**

Optional information indicating the next time of visibility for the resolved position; "UNKNOWN" if the information is not available.

**56b. Next Time of Visibility A Doppler Position**

Same as MF#56a above but for A Position.

**56c. Next Time of Visibility B Doppler Position**

Same as MF#56a above but for B Position.

**56d. Next Time of Visibility of Encoded Position**

Same as for MF#56a but for the Encoded Position.

**57. Beacon HEX ID & Homing Signal**

Fifteen character hexadecimal representation of beacon identification code and type of homing signal as per table below. Information is taken from the Beacon Message (reference MF#23) by the MCC. If the Beacon Message is invalid per C/S A.001, section III/B.1.1.3, then the fifteen character hexadecimal representation shall be based on bits 26 - 85 of the Beacon Message with no bits defaulted.

**Homing Signal Interpretation**

<u>Term</u>	<u>Meaning</u>
NIL	no homing transmitter
121.5	121.5 MHz ELT/EPIRB signal in addition to 406 MHz
Maritime	9 GHz Search and Rescue Radar Transponder (SART) in addition to 406 MHz
Other	a nationally assigned signal has been included in the beacon.

**58. Activation Type**

Type of beacon activation for USER protocols only (non-location protocols).

MANUAL	IF BIT 108 IS SET TO 0
AUTOMATIC OR MANUAL	IF BIT 108 IS SET TO 1

For Ship Security (Standard Location Protocol), enter MANUAL.

Enter "NIL" if the Beacon Message is invalid per C/S A.001, section III/B.1.1.3.

**59. Beacon Number**

Beacon number on the vessel or aircraft. Information is determined by decoding the 406 MHz message.

Enter "NIL" if the Beacon Message is invalid per C/S A.001, section III/B.1.1.3.

**60. Other Encoded Information**

Other information decoded from the Beacon Message as determined by the servicing MCC. Could include such information as Cospas-Sarsat certificate number, resolution of the encoded position data, or data according to national assignment.

When encoded position data is present, the degree of resolution may be provided by the following:

For user location protocol beacons when location data is present in PDF-2 enter 'ENCODED POSITION UNCERTAINTY PLUS-MINUS 4 MINUTES OF LATITUDE AND LONGITUDE'.

For standard location protocol beacons when location data is present in PDF-1 and missing in PDF-2 enter 'ENCODED POSITION UNCERTAINTY PLUS-MINUS 30 MINUTES OF LATITUDE AND LONGITUDE'.

For national location protocol beacons when location data is present in PDF-1 and missing in PDF-2 enter 'ENCODED POSITION UNCERTAINTY PLUS-MINUS 4 MINUTES OF LATITUDE AND LONGITUDE'.

Enter 'NIL' if no other encoded information is available or if the Beacon Message is invalid per C/S A.001, section III/B.1.1.3.

For protocol containing the aircraft 24-bit address, the country which assigned the 24-bit address will be indicated. If the country that assigned the 24-bit address is unknown, this value will be set to "UNKNOWN". If the registration marking corresponding to the 24-bit address is known, it will be given. If the registration marking is unknown, the full 24-bit address will be given as a 6 character hexadecimal number.

## 61. Operational Information

Operational information obtained separately from encoded beacon information such as:

- reliability indicator for encoded or Doppler position data \*
- database registry information
- people on board
- 'NIL' if not available.

The statement, "THE [A/B] POSITION IS LIKELY TO BE AN IMAGE POSITION." shall be included, as appropriate, per the "LEOSAR Image Position Determination" algorithm in Appendix B.2 to Annex B. Determining that a position is an image prior to ambiguity resolution is optional.

Note 1: \* The warning "RELIABILITY OF DOPPLER POSITION DATA - SUSPECT" for 406 MHz solutions shall be included on the SIT 185 message when at least one of the following criteria from the alert data values is satisfied:

- Window factor  $\geq 3$ , or
- Bias standard deviation  $> 20$  Hz, or
- The absolute value of the cross track angle is  $< 1$  or  $> 22$ , or
- Position calculated from  $< 4$ -point solution.

This warning is only included in messages before ambiguity resolution.

Note 2: \* The warning "RELIABILITY OF DOPPLER POSITION DATA - SUSPECT DUE TO SATELLITE MANOEUVRE." shall be included in the SIT 185 message during the 24-hour period after the manoeuvre, when the maximum expected error in Doppler location exceeds 10 kilometres within 24 hours of the manoeuvre. See C/S A.001, section 3.7.5.

Note 3: \* The warning "WARNING: AMBIGUITY IS NOT RESOLVED" shall be included in the SIT 185 message for an Unresolved Doppler Position Match, as defined in document C/S A.001, Annex III / B.2.

If the Beacon Message is invalid per C/S A.001, section III/B.1.1.3 then the warning "DATA DECODED FROM THE BEACON MESSAGE IS NOT RELIABLE" shall be included in SIT 185 message.

**62. Remarks**

Heading for the variable length section of the message. Additional information may be provided at the discretion of the originating MCC as illustrated in the sample alert messages. 'NIL' if no Remarks are available.

For ship security alerts the following should be included: "THIS IS A SHIP SECURITY ALERT. PROCESS THIS ALERT ACCORDING TO RELEVANT SECURITY REQUIREMENTS."

**63. End of Message**

To indicate to the message recipient that no more information is to come on this message.

**64. SARR Frequency Calibration Offset**

Difference (in Hz) between the computed frequency produced by the calibration LEOLUT and the known transmit frequency of a reference beacon.

The SARR frequency calibration offset prepared for distribution to other MCCs shall be based on the average of a minimum of twenty satellite passes, each of which includes at least ten data measurements and each of which is associated with a computed location which is accurate to within three kilometres.

**65. SARR Frequency Calibration Drift**

Drift (in Hz/day) of the SARR frequency provided by the LEO satellite.

**66. Time of SARR Frequency Calibration Determination**

Time when a SARR frequency calibration offset for a given LEO satellite was determined through the procedure described for MF # 64.

**67 - 76 Reserved for MEOSAR**

## **APPENDIX B.2 TO ANNEX B**

### **DETERMINING THE LEOSAR IMAGE POSITION**

The LEOSAR Doppler processing produces two solutions for each satellite pass; a “real” position corresponding to the actual location of the beacon and an “image” position on the opposite side of the satellite track. Prior to determining the “real” position of a beacon, it is possible to use unlocated alert data to determine if one position is an image, as summarised in Figure B.2.

The LEOSAR image position can be determined using the following inputs:

- a) LEOSAR Doppler alert, including beacon ID, A and B latitude/longitude positions (defined as Input “I<sub>2</sub>” in the DDP);
- b) GEOSAR or LEOSAR unlocated alert with beacon ID (defined as Input “I<sub>1</sub>” in DDP); and
- c) ephemeris data and orbit propagation software, if the unlocated alert originated from a LEOSAR satellite, or the position of the GEOSAR satellite if the alert originated from a GEOSAR satellite.

Figure B.1 and the text below document the procedures for MCCs to follow to determine if a position is inside the footprint of the LEOSAR or GEOSAR satellite at time of detection, and whether a position is an image.

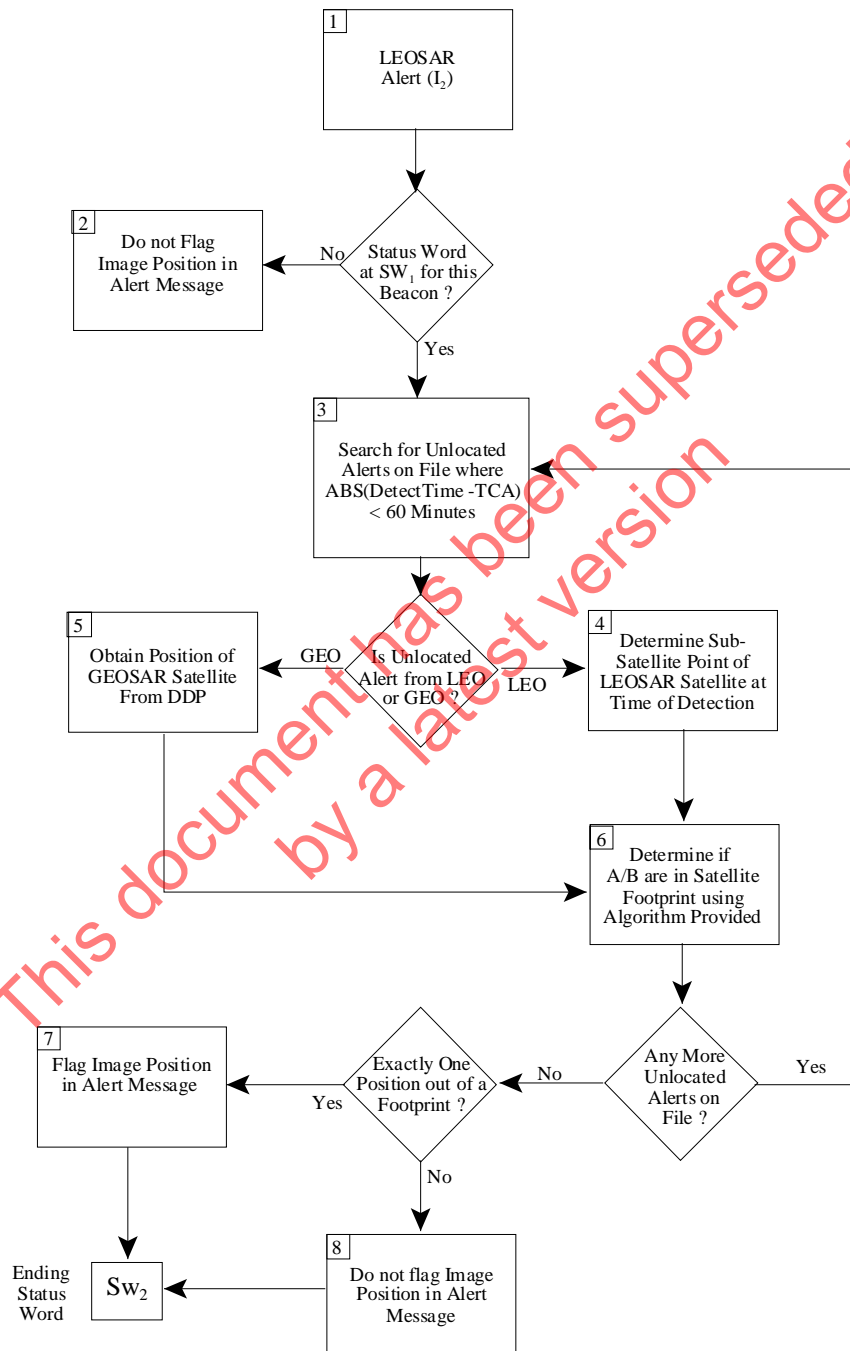

The process of determining an image position is triggered when a LEOSAR Doppler alert (I<sub>2</sub>) is received at the MCC (reference process 1 in Figure B.1) for a beacon which has been previously detected, but no location information is available (I<sub>1</sub>). The status of the MCC processing prior to receiving the LEOSAR Doppler alert must be at Sw<sub>1</sub> (i.e., only identification information available, no location information present). If the status of the MCC processing is not at Sw<sub>1</sub>, then an image position will not be indicated when the alert message is sent by the MCC.

All unlocated alerts on file with a detect time within 60 minutes of the Doppler TCA are examined (reference 3) to determine if the image position can be determined. For LEOSAR unlocated alerts the time of the detection, along with orbit propagation software, is used to determine the sub-satellite position of the LEOSAR satellite at time of detection (reference 4). For GEOSAR satellites the sub-satellite position is obtained from Table II/F.3 in the DDP (reference 5).

Each of the LEOSAR Doppler positions are analysed to determine if they are within the GEOSAR or LEOSAR unlocated footprint using the algorithm shown in Figure B.2 and using the sub-satellite points as input (reference 6). Each unlocated footprint must be analysed before a position can be determined to be an image.

If one of the LEOSAR Doppler positions is conclusively outside the footprint for at least one unlocated alert, then it is the image position, as long as the other position is inside the footprint of every unlocated alert. If neither position is outside of any footprint or each position is outside of any footprint, then the image position cannot be determined.

When a position has been determined to be an image, this will be indicated on the alert message sent by the MCC, as specified in the description of Message Fields 24 and 61 in Appendix B.1 to Annex B.

**Figure B.1: Using Unlocated Alerts to Determine and Flag the Image Position**

Input:	lat	LEOSAR computed position latitude in degrees
	lon	LEOSAR computed position longitude in degrees
	llat	GEOSAR or LEOSAR sub-satellite point at time of detection, latitude in degrees
	llon	GEOSAR or LEOSAR sub-satellite point at time of detection, longitude in degrees
	Emin	Minimum elevation angle required (set to -5 degrees)
Constants:	Rg	altitude of GEOSAR or LEOSAR satellite (note difference in Sarsat and Cospas)
	Re	Equatorial radius of earth = 6378 km
	ro	$Re / (Re + Rg)$
	PI	3.1415927
Compute:	rlat	$= PI * lat / 180$
	r lon	$= PI * lon / 180$
	rllat	$= PI * llat / 180$
	rllon	$= PI * llon / 180$
	c	$= \sin(rlat) * \sin(rllat) + \cos(rlat) * \cos(rllat) * \cos(rllon - rlon)$
	e	$= (c - ro) / \sqrt{1 - c^2}$
	E	$= 180 * \arctan(e) / PI$
Output:	If $E \geq Emin$ then LEOSAR computed position is within satellite footprint, else If $E < Emin$ then LEOSAR computed position is outside satellite footprint	

**Figure B.2: Algorithm to Determine if Computed Position is Inside Satellite Footprint**

**APPENDIX B.3 TO ANNEX B****SUGGESTED ALGORITHM FOR MESSAGE SEQUENCE TRACKING**

The flowcharts in this Appendix define a procedure for the identification of missed messages through message sequence tracking. The procedure relies on the following data items or structures:

<b>Data Item</b>	<b>Purpose</b>
CurMsgNo	The current message number contained in MF#1 of the arriving message
PrvMsgNo	The previous message number contained in MF#1 of the arriving message
NextExpected	The next message number expected from a given source. This item could be represented as an array indexed by source: NextExpected [ MF#2 ] i.e. each MCC must maintain a table of NextExpected message numbers – one such number for each reporting MCC. When a message is received, the reporting MCC in MF#2 is used to lookup the appropriate NextExpected message number from the table.
MissedMsgList	A list of messages that have been identified (by the sequence checking procedure) as overdue. MCCs may choose to implement this as a single list of MF#2:MF#1 pairs or maintain a separate list for each source.
TimeMissed	The time at which a message was declared “missing” by the message sequence tracking facility. The message would be added to the MissedMsgList at that time.
MAX_MISSING	A configuration constant that limits the number of missed messages that can be generated by a single sequence check. This minimises the impact of an MCC unilaterally resetting its message sequence generator to an arbitrary value. Set to [15].
MAX_MSGNO	A configuration constant that defines the largest message number before message number wrap around is to occur. Set to 99999.
MAX_WAIT_TIME	A configuration constant that defines the length of time the MCC will wait for an out of sequence message to arrive before a lost message is declared (and recovery action initiated). Set to [20 minutes].

The procedure is executed in two threads (parallel streams of execution):

1. message-checking thread, where each arriving message is subjected to a message sequence check; and
2. monitor thread which constantly checks the missed message list for lost messages.

The two threads are represented in separate flowcharts.

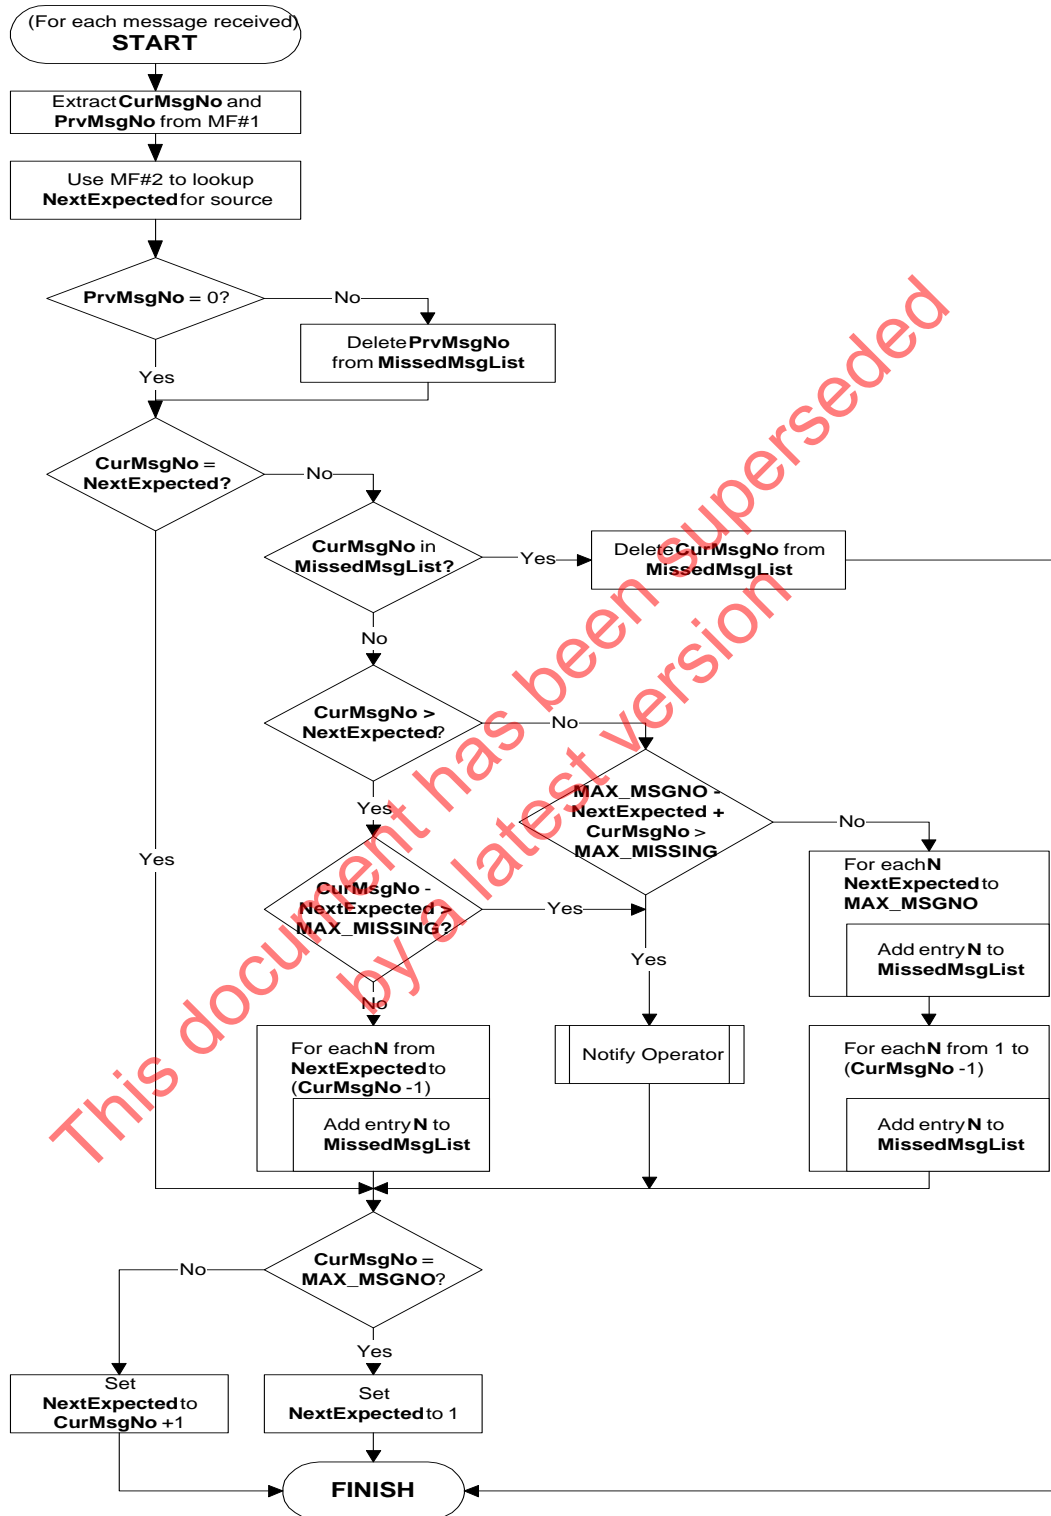

Figure B.3: Message Sequence Checking Flowchart

## **ANNEX C**

### **MESSAGE CONTENT BY SIT**

#### **1. MESSAGE TEXT FORMATS**

---

Cospas-Sarsat messages are uniquely identified by specific Subject Indicator Types (SITs). The SIT specifies the format and category of content within the message. MCCs process messages automatically. Therefore it is mandatory that the structure of the message formats be adhered to, so that each MCC can route and / or take action as required by the message. Tables C.1, C.2 and C.3 detail the format of the text for all messages exchanged between the MCCs in terms of Message Fields (MFs) used.

Once the SIT is known for the desired message, the corresponding column identifies which Message Field number (MF#) is necessary to produce the message. Annex B is then used to find the format and the produced message will be similar to those given in the Appendix to this Annex.

#### **2. SAMPLE MESSAGE TEXT**

---

For SIT messages depicted in Tables C.1, C.2 and C.3, sample messages are given in Appendix 1 to this Annex. A sample for multi-SIT messages is also provided in Appendix 1. The sample messages in Appendix 1 also indicate the message line that contains the individual MF#.

where:

a = number of lines required for MF#61

b = number of lines required for MF#62

c = number of lines required for MF#63

The underline "\_" is an indication where the New Line (NL) code is to be inserted.

**APPENDIX C.1 TO ANNEX C****SAMPLE MESSAGES****1. GENERAL**

This Appendix contains examples of messages formatted for transmission. The examples are shown double spaced for ease of reading. Each example is composed of 3 sections:

- a. FORMAT FRAMES
- b. MF #
- c. CONTENT

**1.1 Format Frames**

The FORMAT FRAME corresponds to the required format given in Section 4 of the document. The INFO frame contains the text message and can therefore be formatted as required by Cospas-Sarsat. The HEADER and TRAILER frames are specified by the host network.

**1.2 MF #**

This MF # provides the field number used within a particular message line and correspond to the MF # shown in Tables C.1, C.2 and C.3.

**1.3 Content**

This Section contains the actual information transmitted. Only the content in the examples is transmitted and not the FORMAT FRAME column and the MF #s column.

**1.4 SIT 185**

Because of its nature, examples for SIT 185 are presented differently than examples for other SIT messages and shows only the content as it would be printed at the receiving agency.

**2. SAMPLES**

Sample messages for each SIT format are provided in the following pages.

**SAMPLE MESSAGE FOR  
SIT 121**

## **ANNEX E**

### **COSPAS-SARSAT PROTOCOL FOR THE TRANSMISSION OF SIT MESSAGES VIA THE X.25 NETWORK**

#### **E.1 X.25 MESSAGE TRANSMISSION PROTOCOL**

---

MCCs exchange messages in order to distribute information within the Cospas-Sarsat System.

The X.25 network (also referred to as the Public Switched Data Network or PSDN) is a general-purpose global data communication network supporting point-to-point electronic data communications. The X.25 network provides raw data communication capabilities.

The Cospas-Sarsat protocol for the transmission of SIT messages via the X.25 network builds upon the recommendations of the CCITT. These recommendations can be found in the publication "CCITT Blue Book, (Volume VIII – Fascicle VIII.2) Data Communication Networks: Services and Facilities, Interfaces Recommendations X.1-X.32".

Within the Cospas-Sarsat ground segment, the X.25 network may be used for the transmission of message data from one MCC to another. While the X.25 network allows MCCs to establish real-time data links, the CCITT recommendations themselves do not specify how messages should be exchanged over these links.

MCCs must exchange messages efficiently and reliably without data corruption or loss. There is a possibility for data loss within the X.25 network if the correct data exchange procedures are not observed. Therefore, it is mandatory that each MCC conduct message exchange in accordance with an agreed protocol.

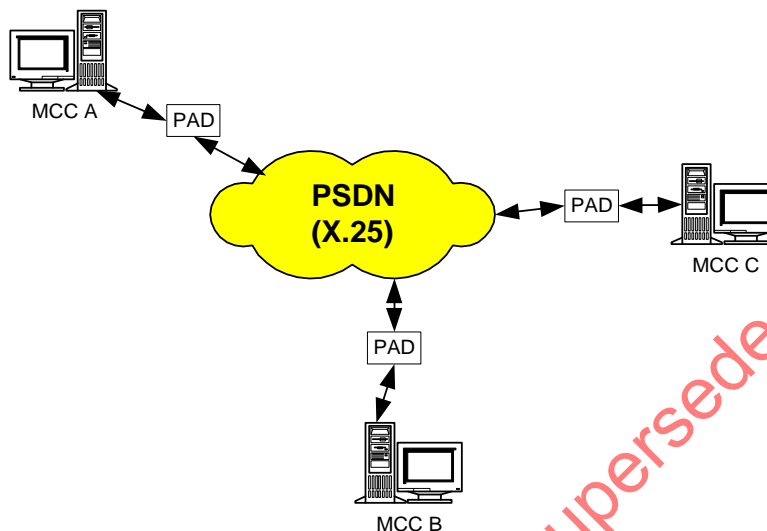

This Annex specifies a basic message transmission protocol to be used by MCC computers when exchanging messages over the X.25 network.

#### **E.2 X.25 NETWORK BASICS**

---

The X.25 network is a global data network that allows computers to establish connections and exchange data. Data and control signals are conveyed across the X.25 network in discrete units called packets.

The following diagram shows the basic configuration of MCCs and the X.25 network.

An MCC computer is connected to the X.25 network via a Packet Assembler/Disassembler (PAD).

A PAD converts the continuous stream of message bytes output from an MCC into discrete packets for transmission on the X.25 network. The destination PAD converts the arriving packets back to a continuous stream of message bytes for processing by the receiving MCC.

The X.25 network can support permanent, semi-permanent and transient connections between MCCs. This document only describes procedures that relate to transient connections.

A transient X.25 connection is similar to a telephone call. The calling MCC uses its local PAD to place an X.25 call to the called MCC. The calling MCC must provide the X.25 network address (or number) of the called MCC. The PAD of the called MCC accepts the X.25 call thereby establishing a data connection between the two MCCs.

Once the connection has been established, the two MCC exchange data until one of the MCCs instructs its local PAD to clear the call. The X.25 connection is then complete. Within the Cospas-Sarsat System, most connections last only a few seconds.

### **E.3 X.25 RELATED PUBLICATIONS**

A comprehensive technical description of the standards relating to the X.25 network are contained in publications of the International Telecommunications Union's (ITU) International Telegraph and Telephone Consultative Committee (CCITT) "Blue Book, (Volume VIII – Fascicle VIII.2) Data Communication Networks: Services and Facilities, Interfaces Recommendations X.1-X.32".

In particular the following recommendations are of direct relevance to MCCs which use the X.25 network:

- a) Recommendation X.25 – Interface between terminals and the packet mode public data networks;
- b) Recommendation X.28 – Interface between terminal equipment accessing a PAD in a public data network; and
- c) Recommendation X.29 – Procedures for the exchange of control information and data between PADs or a PAD and a packet mode terminal.

These publications are available via the ITU web site at <http://www.itu.int/>.

#### **E.4 BASIC REQUIREMENTS FOR AN MCC CONNECTED TO THE X.25 NETWORK**

This section describes the basic requirements that must be met by an MCC with respect to its X.25 network connection.

- a) an MCC connected to the X.25 network shall comply with the applicable CCITT recommendations;
- b) unless otherwise stated in this protocol, each MCC shall use default values for all parameters associated with the X.25 network and associated connections. All MCCs shall be capable of establishing an X.25 connection using the following parameters:

Packet size	128 bytes
Window size	2 packets

These and other default values are specified in the CCITT recommendations. On a bilateral basis, MCCs can use other values for these parameters;

- c) each MCC shall be capable of processing multiple simultaneous inbound and outbound X.25 connections; and
- d) each MCC shall be able to send data to another MCC on a connection it opened concurrent with receiving data on a connection opened by the other MCC.

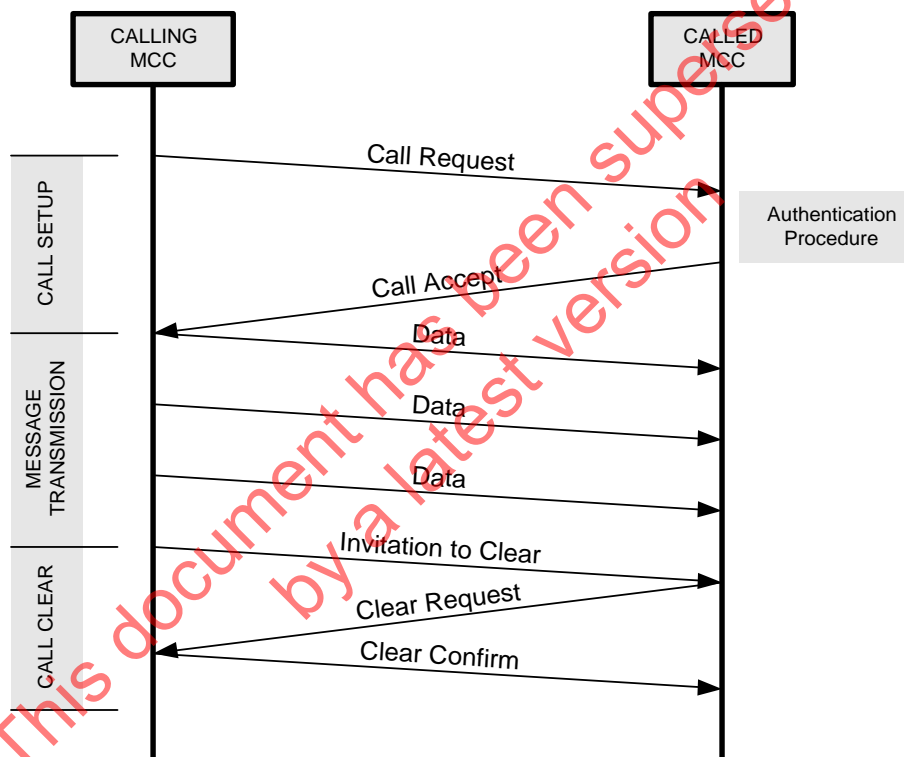

## E.5 X.25 CONNECTIONS

Figure E.1 depicts the phases of an X.25 connection.

**Figure E.1: Phases of an X.25 Connection**

Figure E.2 shows the timing of packet flow in a typical X.25 connection.

**Figure E.2: Packet Flow in a Typical X.25 Connection**

The following sections describe procedures that shall apply during each phase of the X.25 connection.

### E.5.1 X.25 CALL SET-UP

The calling MCC initiates a connection via its local PAD which responds by issuing a **Call Request Packet**. Upon detecting the incoming call, the called MCC shall execute its authentication procedure to accept or reject the call. Subsequently, the called PAD will issue a **Call Accept Packet** or **Clear Request Packet**.

The exchange of the various control packets by the PADs is conducted according to the CCITT recommendations. In addition to the CCITT recommendations, MCCs must observe the following protocol:

- a) an MCC with message data to transmit (the calling MCC) shall initiate the X.25 connection to the destination MCC (the called MCC);
- b) the calling MCC shall provide sufficient information in the **Call Request Packet** to satisfy the called MCC's authentication procedure;
- c) an MCC shall only initiate one connection at a time to another MCC; and
- d) the calling MCC shall consider the call set-up procedure to be successful only upon receipt of a **Call Accept Packet**. Any other result shall be regarded as a failure of the X.25 connection.

### E.5.2 AUTHENTICATION PROCEDURE

An MCC shall enforce the following authentication procedure to ensure that only authorised MCCs are permitted to establish X.25 connections. The authentication procedure makes use of the following information to verify the identity of the calling MCC:

- the authorised X.25 called address;
- the X.25 calling address (referred to as caller ID or CID); and
- call user data (CUD), a maximum of 16 bytes of agreed "password" data.

This above information shall be provided by the calling MCC in the **Call Request Packet**.

The following protocol shall be observed:

- a) Specific X.25 called address, CID and CUD values shall be determined by MCCs on a bilateral basis.
- b) The called MCC shall reject the call request if the required information is absent or inaccurate. Rejection of the call request shall be signalled by clearing the connection.

### E.5.3 MESSAGE TRANSMISSION

The following procedure shall apply to the message transmission phase:

- a) immediately after call set-up is completed, the calling MCC shall transmit all of its message data;
- b) the calling MCC may send more than one SIT message during a single connection;
- c) when sending a SIT message via X.25, an MCC shall set the “M” bit in every packet except the last packet, to indicate that the series of data packets comprise one SIT message;
- d) once all data has been transmitted the calling MCC shall commence the call clear procedure by issuing an “invitation to clear (ITC)”;
- e) after sending an ITC, the calling MCC shall send no more data on the X.25 connection; and
- f) the called MCC shall not transmit any data packets (data packets received by the calling MCC shall be deemed to be a failure of the X.25 connection).

### E.5.4 CALL CLEAR PROCEDURE

Message data may be lost in the X.25 network if the connection is not correctly cleared. The following procedure shall be implemented to clear the X.25 connection:

- a) The calling MCC shall issue an ITC once all message data has been transmitted.
- b) Upon receiving an ITC, the called MCC shall immediately clear the connection by sending no diagnostic or by sending a clear diagnostic of 0.
- c) After sending an ITC, the calling MCC shall set a timer to ensure that the called MCC responds with a clear. If this timer expires, the calling MCC shall initiate a clear immediately and shall regard this event as a failure of the call clear procedure and of the X.25 connection. The period of this timer shall be 30 seconds. If the calling MCC clears the connection due to a timeout, it should set the clear diagnostic to 50.
- d) On accepting a connection, the called MCC shall set an idle timer. Whenever data is received the called MCC shall reset the idle timer. If this timer expires, the called MCC shall clear the connection immediately. The period of this timer shall be 45 seconds. If the called MCC clears the connection due to a timeout, it should set the clear diagnostic to 49.

- e) The calling MCC shall deem the call clear procedure to be successful only if, after issuing an ITC, it receives a Clear Indication with a clear cause of 0 or 128 - 255 (which indicates a clear originating at the called MCC) and a diagnostic of 0. If the connection is cleared in any other way the calling MCC shall deem the call clear procedure and the connection to have failed.
- f) The called MCC shall attempt to process all message data received on the X.25 connection irrespective of the manner in which the connection is cleared.

Figure E.3 depicts the clearing of the connection by the calling MCC should the called MCC fail to respond to the ITC for any reason.

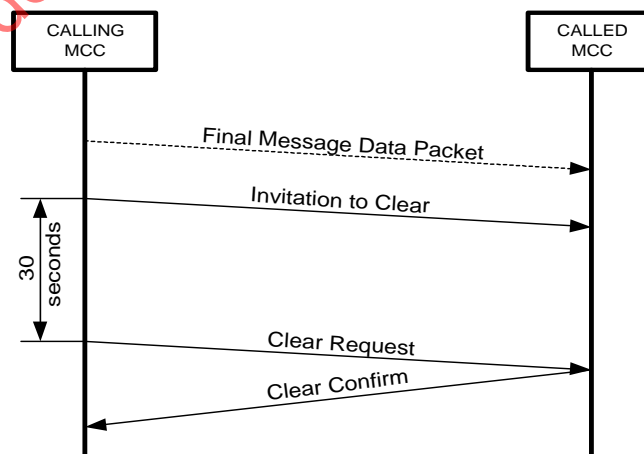

Figure E.4 depicts the clearing of the connection by the called MCC should the connection remain open for any reason.

## E.6 SUCCESSFUL TRANSMISSION AND RETRIES

The calling MCC shall deem a connection to be successful only if each phase of the X.25 connection (Call Set-up, Authentication, Message Transmission and Call Clear) is successfully completed.

In the event of a connection failure, the calling MCC shall consider all messages sent during the connection to be undelivered.

To cater for transient problems in the X.25 network (e.g. network congestion, remote party busy) the calling MCC may repeat (retry) an X.25 connection in the event of the failure of a connection. The time interval between retries shall not be less than 15 seconds.

**Figure E.3: Clearing Procedure if ITC Fails**

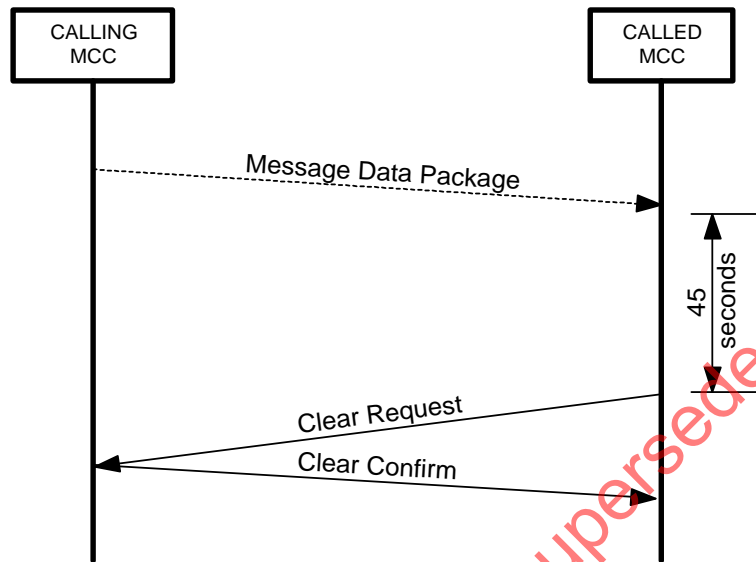

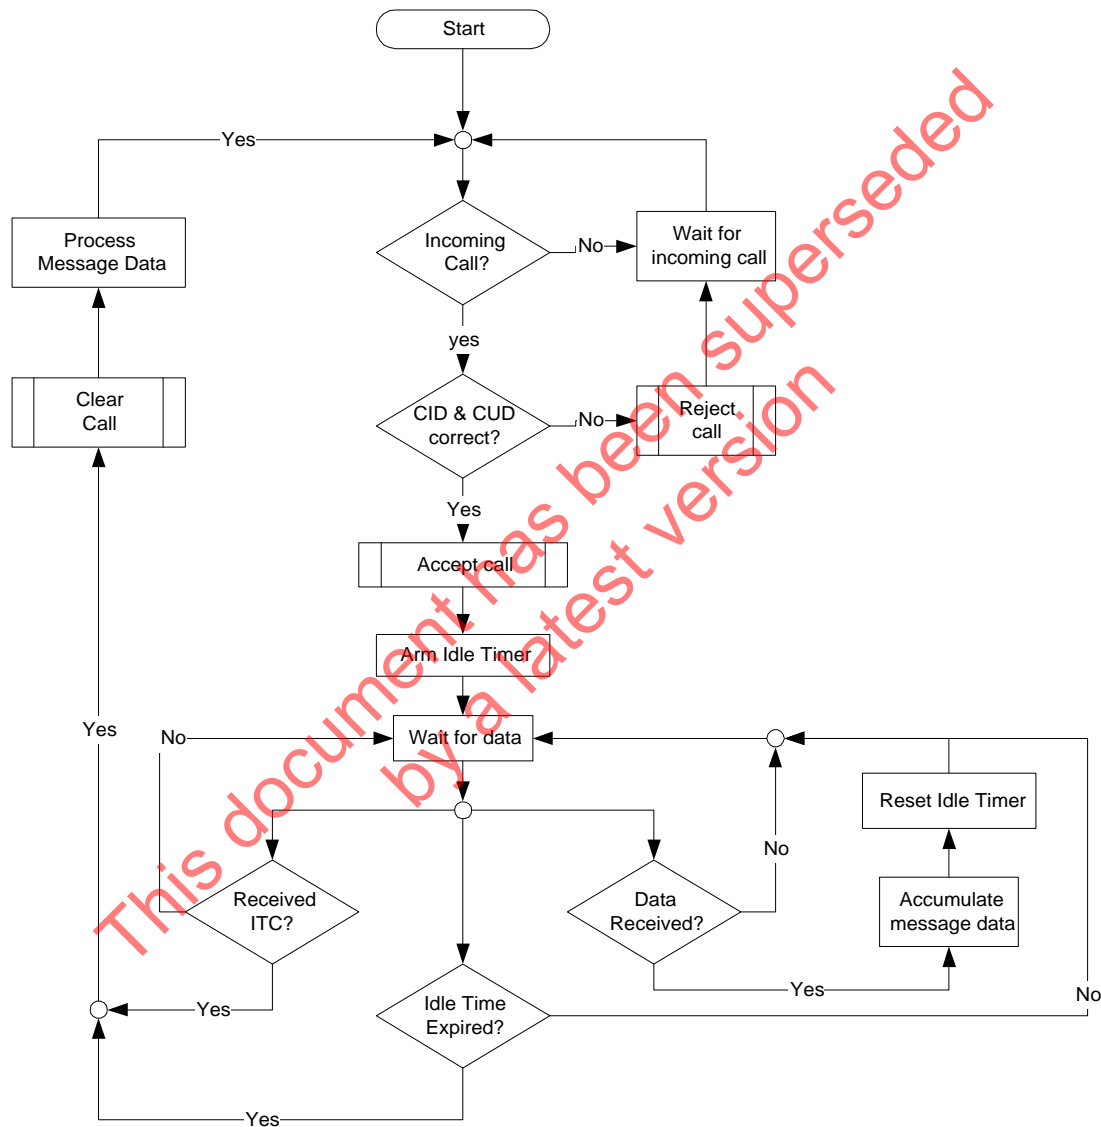

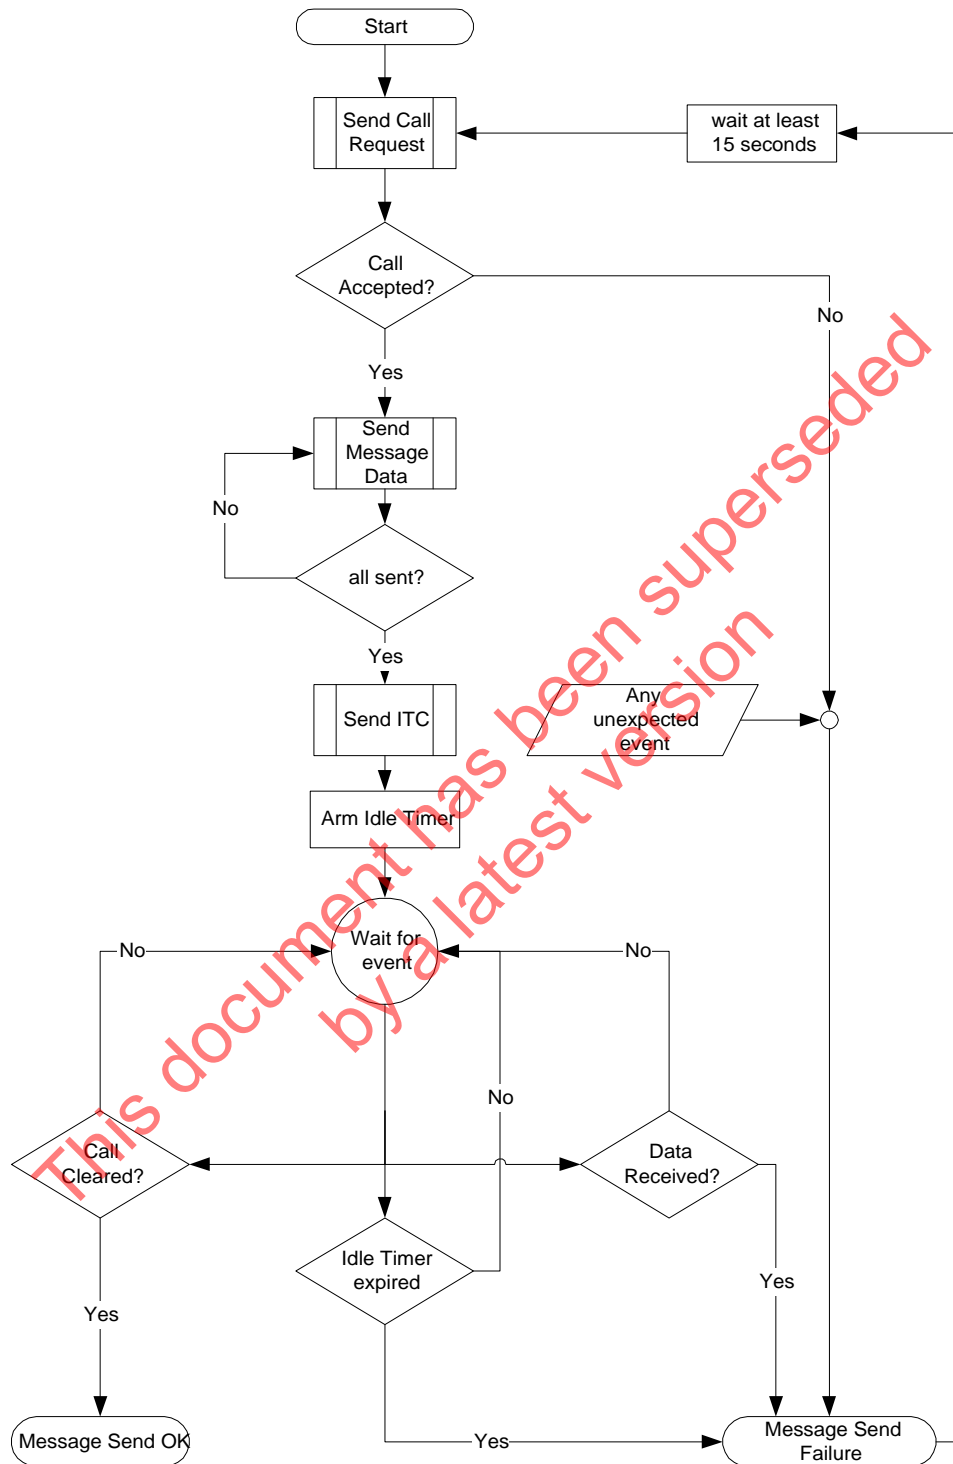

Figure E.4: Clearing Procedure by Called MCC

**APPENDIX E.1 TO ANNEX E****X.25 CONNECTION PROCEDURES**

The following flowcharts depict the basic procedures to be followed when transmitting or receiving a message via the X.25 network.

**Figure E.5: X.25 Network Message Reception Procedure for the Called MCC**

**Figure E.6: X.25 Network Message Transmission Procedure for the Calling MCC**

**APPENDIX E.2 TO ANNEX E****DEFINITION OF X.25 TERMS**

CALL REQUEST	An X.25 control packet used by a PAD to establish an X.25 connection to a remote PAD.
CALL ACCEPT	An X.25 control packet issued by a PAD when accepting an incoming X.25 call.
CALL REJECT	An X.25 control packet issued by a PAD when rejecting an incoming X.25 call. The packet contains "cause" and "diagnostic" codes indicating the reason for the rejection. For further information refer to the CCITT specification.
CALLING MCC	The MCC initiating the X.25 connection to the called MCC for the purpose of transmitting SIT message(s) to the called MCC.
CALLED MCC	The MCC accepting an incoming X.25 connection for the purpose of receiving SIT messages from the calling MCC.
CLEAR CONFIRM	An X.25 control packet issued by a PAD acknowledging the receipt of a Clear Request packet.
CLEAR REQUEST	An X.25 control packet issued by a PAD to inform the remote PAD that the connection has been terminated.
CLEAR INDICATION	A signal from an X.25 PAD indicating that the X.25 connection to the remote party has been cleared.
CID	Caller ID. The X.25 address advertised by the calling MCC and sent to the calling MCC in the call request packet. The CID field is defined in CCITT recommendation X.25 section 5.2.1.
CUD	Call User Data provided by the calling MCC to allow the called MCC to verify the identity of the caller. Maximum length is 16 bytes. The CUD field is defined in CCITT recommendation X.25 section 5.2.2.5.
ITC	Invitation to Clear. An X.25 control packet issued by the calling MCC, inviting the called MCC to clear the X.25 connection. The format of the ITC is defined in CCITT recommendation X.29 section 4.4.8.

M BIT	“More Data bit”. When set (ON), indicates that the current message is continued in the next packet. When reset (OFF) indicates the end of the current message. The M bit is defined in CCITT recommendation X.25 section 5.3.1.4.
PAD	Packet Assembler/Disassembler. Termination unit for an X.25 network. A PAD in the X.25 network is analogous to a telephone handset in the public telephone network.
PACKET	A collection of data and/or control information transported as a discrete unit across an X.25 network connection. A packet may contain up to 128 bytes of data.

## **ANNEX F**

### **COSPAS-SARSAT STANDARD FOR THE TRANSMISSION OF SIT MESSAGES VIA FTP**

#### **F.1 FILE TRANSFER PROTOCOL (FTP) COMMUNICATIONS**

---

Each MCC communicating via FTP shall comply with the applicable standards described in the Internet Engineering Task Group document RFC 959 - File Transfer Protocol, which can be found at the following web address: [www.ietf.org](http://www.ietf.org).

##### **F.1.1 FILE NAMING CONVENTION**

An MCC shall send a SIT message by writing a file on the FTP server of the receiving MCC. Each file shall contain exactly one SIT message.

The FTP file name format shall be “?SRCE\_?DEST\_?CUR#.TXT”, where:

- “?SRCE” is the Source MCC Name (per Table II/A.1 at Annex II/A to C/S A.001),
- “?DEST” is the Destination MCC Name (per Table II/A.1 at Annex II/A to C/S A.001),  
and
- “?CUR#” is the Current Message Number (Message Field 1).

The FTP file name shall contain only upper case characters. For example, a file with the name “USMCC\_CMCC\_02345.TXT” contains Current Message Number 02345 sent by the USMCC to the CMCC.

Any MCC that wants to receive data via FTP shall provide the Host Name and/or Internet Protocol (IP) Address, User Name, Password, and Message Directory Name in Table F.1, to enable other MCCs to place data on the FTP server of the receiving MCC. On a bilateral basis, the receiving and sending MCC should agree on passwords and other security measures. It is the responsibility of the receiving MCC to provide adequate security for its FTP server.

The sending MCC shall write a file with a file name extension of “.TMP” on the FTP server of the receiving MCC. A file is given a temporary name to prevent the receiving MCC from processing a file before it is complete. Once the file transfer is complete, the sending MCC shall rename the file with an extension “.TXT”. Once the file has been renamed, the sending MCC shall not manipulate the file. The receiving MCC shall not process files with an extension of “.TMP”. The receiving MCC shall be responsible for disposing of files placed on its FTP server. If the receiving MCC detects an anomalous condition in the FTP file transfer, it shall notify the transmitting MCC.

If a FTP file transfer fails for any reason the transmitting MCC shall try to resend the message, and notify the receiving MCC if the failure persists.

Each MCC communicating via FTP shall operate in binary transfer mode.

## **F.2 FILE TRANSFER PROTOCOL (FTP) INFORMATION LIST**

---

A list of information used to send messages to an MCC via FTP is provided in this section. This list is composed of 6 items:

1. Receiving MCC
2. Host Name
3. IP Address
4. User Name
5. Password
6. Message Directory Path

### **F.2.1 Receiving MCC**

The name of the MCC to receive data via FTP. This name matches the MCC Identification Code in Table II/A.1 at Annex II/A to C/S A.001.

### **F.2.2 Host Name**

This is the FTP Host Name of the receiving MCC. \*\*\* indicates that the Host Name is provided on a need to know basis.

### **F.2.3 Internet Protocol (IP) Address**

This is the Internet Protocol Address referenced to reach the receiving MCC. \*\*\* indicates that the IP Address is provided on a need to know basis.

### **F.2.4 User Name**

The User Name required to login to the FTP server of the receiving MCC. If the value is "Sending MCC Name", then the user name is the name of the sending MCC, per Table B.2. \*\*\* indicates that the User Name is provided on a need to know basis.

### **F.2.5 Password**

The password required to access the FTP server of the receiving MCC. \*\*\* indicates that the Password is provided on a need to know basis.

### **F.2.6 Message Directory Path**

The path of the directory into which message files shall be written. <MCCname> indicates that each MCC will put messages in a sub-directory per MCC, where the sub-directory name is the name of the sending MCC, per Table II/A.1 at Annex II/A to C/S A.001.

## **F.3 SECURITY**

---

All MCCs with an Internet connection must be protected by firewall technology.

### **F.3.1 Passwords**

MCCs shall formulate passwords using security best practices. The passwords shall have the following characteristics:

- Contain at least 8 characters
- Not have any characters that are “blank”
- Six of the characters shall occur once in the password
- At least one of the characters must be a number (0-9) or a special character (~,!,\$,#,%,\* ) – see Table F.2
- At least one of the characters must be from the alphabet (upper or lower case)
- Passwords shall not include:
  - words found in any dictionary (English or other language), spelled forward or backward
  - system User Ids
  - addresses or birthdays
  - common character sequences (e.g., 123, ghijk, 2468)
  - vendor-supplied default passwords (e.g., SYSTEM, Password, Default, USER, Demo)
  - words that others might guess

MCCs shall change passwords at least semi-annually.

To protect passwords from unauthorized disclosure MCCs shall exchange passwords by telephone or facsimile if allowed by security authorities at each MCC. MCCs shall coordinate the exchange of new passwords during the last full work week of April and October of each year. MCCs exchanging passwords shall agree on an implementation date that is not later than the end of the week during which new passwords are exchanged.

**Table F.1: FTP Password Special Characters**

SYMBOL	NAME
~	TILDE
!	EXCLAMATION POINT
@	AT SYMBOL
#	OCTOTHORPE
\$	DOLLAR SIGN
%	PERCENT
^	CHAPEAU / HAT
&	AMPERSAND
*	ASTERIX
)	CLOSE PARENTHESES
(	OPEN PARENTHESES
`	APOSTROPHE
-	HYPHEN
“	QUOTATION
/	VIRGULE

**F.3.2 Access**

Access permissions on all directories and files on the FTP server shall follow the principle of “least permissions” to ensure that no unauthorized access is allowed. “Least permissions” means that each user is granted the minimum access required to perform their assigned tasks.

MCCs shall check IP addresses to limit server access only to authorized users.

MCCs shall allow access to their FTP servers only through ports 20 and 21. All other ports that are not being used shall be closed.

**F.3.3 Anonymous FTP**

MCCs shall not use anonymous FTP.

**F.3.4 Encryption of Critical Information**

MCCs shall implement methodologies to encrypt FTP login names (userids) and passwords during file transmission to prevent unauthorized disclosure. These methodologies include FTP over Internet VPN. Standards for the use of hardware VPN are contained in Annex G.

**F.3.5 Monitoring for a Potential Security Breach**

MCCs shall monitor the FTP servers for abnormal activity. If a breach of security is found, MCCs shall notify all FTP correspondents as soon as possible to minimize exposure.

Examples of items that should be monitored on a FTP server include:

Event logs

- Should be set and checked for failed login attempts
- Gaps in time and date stamps
- Attempts to elevate privileges

Disk Space

- Unexplained loss of disk space
- Unexplained disk access

Unexplained events

- Large number of failures (system or programs crash)
- Unexplained process or programs running
- New users added
- Virus protection has been disabled

### **F.3.6 Security Patches**

MCCs shall apply the latest software and security patches to their FTP servers as soon as possible.

- END OF ANNEX F -

## **ANNEX G**

### **COSPAS-SARSAT STANDARD FOR THE TRANSMISSION OF SIT MESSAGES VIA HARDWARE VPN**

#### **G.1 INTRODUCTION**

---

A Virtual Private Network (VPN) provides a secure method to transmit information over the Internet. A tunnelling technology such as Internet Protocol IPSec is used to set up private connections between separate sites. A tunnel provides a means for forwarding data across a network from one site to another, as if they were directly connected.

Prior to an MCC setup/installation an MCC installer should ensure that the IP address range selected for the MCC's network does not conflict with the IP range of all other MCCs with which it may potentially connect.

IP conflicts will not stop the creation of the VPN tunnel but will prevent the transfer of data using FTP between the hosts.

This aspect is especially relevant when a new ground segment is being installed.

#### **G.2 STANDARDS**

---

##### **G.2.1 Tunnelling**

MCCs that use VPN to transmit data via the Internet shall use IPSec. IPSec is a framework of open standards developed by the Internet Engineering Task Force (IETF). IPSec provides security for transmission of sensitive information over the Internet. IPSec acts at the network layer, protecting and authenticating IP packets between participating IPSec devices ("peers"), such as Cisco routers.

IPSec provides the following network security services:

- Data Confidentiality – The IPSec sender can encrypt packets before transmitting them across a network.
- Data Integrity – The IPSec receiver can authenticate packets sent by the IPSec sender to ensure that the data has not been altered during transmission.
- Data Origin Authentication – The IPSec receiver can authenticate the source of the IPSec packets sent. This service is dependent upon the data integrity service.
- Anti-Replay – The IPSec receiver can detect and reject replayed packets.

### **G.2.2 Mutual Confirmation Method**

This step performs the function of a negotiator. It will allow two IPSec nodes to decide which algorithms they will use for authentication and encryption, as well as how long this session will last. The Cospas-Sarsat standard is the PreShared Key Internet Key Exchange (IKE) method.

### **G.2.3 Code Algorithm (Crypto Algorithm)**

This step applies a mathematical formula to the information to be encrypted. MCCs should implement the highest level of encryption that is available on a bilateral basis. Possible choices include:

DES  
3DES  
CAST128  
Blowfish

### **G.2.4 Confirmation Algorithm**

This step applies an algorithm that is used to validate that both ends of a session (MCCs) are in fact who they claim to be. The Cospas-Sarsat standard is the MD5 confirmation algorithm.

### **G.2.5 Perfect Forward Security**

Perfect Forward Security (PFS) should be set to group 1, 2, or 3.

### **G.2.6 Lifetime**

Specify lifetime at an agreed standard time (e.g. 120 minutes).

## **G.3 HARDWARE CONFIGURATION**

---

Hardware VPN is defined as any piece of commercial or industrial-grade hardware that supports international and non-proprietary VPN standards, for example IPSec. Some possible hardware VPN devices include, but are not limited to Routers, Concentrators, VPN appliances and Firewalls, in any combination.

These devices provide the security called for in section F.3.4 of the FTP standard (Annex F).

## **ANNEX H**

### **COSPAS-SARSAT STANDARD FOR THE TRANSMISSION OF SIT MESSAGES VIA AFTN**

#### **1. INTRODUCTION**

---

The aeronautical fixed telecommunications network (AFTN) is a worldwide system of aeronautical fixed circuits provided, as part of the aeronautical fixed service, for the exchange of messages, and/or digital data between aeronautical fixed stations having the same or compatible communications characteristics. Communication procedures for the AFTN are detailed in Annex 10 to the Convention on International Civil Aviation, Volume II, Communication Procedures, which can be downloaded from the ICAO web site.

AFTN provides a store-and-forward messaging service for the conveyance of text messages, which supports the entire character set authorised for use in Cospas-Sarsat SIT messages.

All AFTN messages include a Transmission Identification (TI) of the form "MSO003" where the TI is comprised of the Channel Identifier (CI) = "MSO" and the Channel Sequence Number (CSN) = "003".

Channel checks (heartbeat) are undertaken between an AFTN station and its AFTN communication centre to ensure the link is available and for synchronising of message numbers. These checks are usually undertaken every twenty minutes on the hour and will contain a unique Channel Sequence Number (CSN).

Although the AFTN communications centre ensures that messages are received correctly in terms of the "heading, address, origin and ending syntax" the system does not perform checks to validate the message text. Some MCCs have reported corruption in AFTN messages. The corruption can be quite severe and obvious to the recipient, however at other times they may be extremely difficult to detect.

The ICAO AFTN standard requires long term retention of AFTN traffic records to be maintained for 30 days. The AFTN standard for retaining messages does not obviate the MCC archiving requirement specified in document C/S A.005 (MCC specification).

#### **2. CATEGORIES AND PRIORITIES OF MESSAGES**

---

The AFTN supports the following categories of messages:

- a) distress messages;
- b) urgency messages;
- c) flight safety messages;

- d) meteorological messages;
- e) flight regularity messages;
- f) aeronautical information services (AIS) messages;
- g) aeronautical administrative messages; and
- h) service messages.

Each AFTN message type has an associated message priority. Section 5 provides recommendations in respect of message priorities for the various SIT message types. The highest priority used in the AFTN is SS followed by DD.

#### **Distress messages (priority indicator SS)**

This message category comprises those messages sent by mobile stations reporting that they are threatened by grave and imminent danger and all other messages relative to the immediate assistance required by the mobile station in distress.

AFTN requires that messages transmitted with an SS priority be acknowledged using the format defined by ICAO. MCCs should ensure that SS priority messages are acknowledged by the MCC itself.

#### **Urgency messages (priority indicator DD)**

This category comprises messages concerning the safety of a ship, aircraft or other vehicles, or of some person on board or within sight.

### **3. AFTN MESSAGE FORMAT**

---

The AFTN message formats for the International Telegraph Alphabet No.2 (ITA2) and International Alphabet No.5 (IA5) formats are provided in Figures 1 and 2. AFTN messages are comprised of a header, message body (SIT MESSAGE), and trailer. The SIT message is to be inserted into the fields identified as "Message Text" indicated in Figures 1 and 2.

AFTN messages cannot exceed 2100 characters in total, and the content of the SIT message inserted into an AFTN message cannot exceed 1800 characters.

#### **3.1 AFTN Address Indicator**

An AFTN address comprises 8 characters of the form:

- a) four-letter location indicator listed in ICAO document, Doc 7910, e.g. YSAR for the Australian RCC/AUMCC, Canberra;
- b) three-letter designator as listed in ICAO document, Doc 8585 e.g., ZSZ ( which has been allocated for Sarsat Centre) for the French MCC and YCY for the Norwegian MCC; and

- c) an additional letter which can represent a department, division or process within the organization/function of the originator. The letter X shall be used to complete the eight-letter address when explicit identification is not required.

### 3.2 Multiple Address Distribution

AFTN includes a facility for distributing messages to multiple addresses. The use of this capability is not recommended for MCC to MCC communications since it reduces the effectiveness of message number sequence checking.

## 4. EXAMPLES OF AFTN MESSAGES

The following are examples of AFTN messages using the IA5 format:

- a) Example of an SS Priority AFTN Message transmitted by the UKMCC to the FMCC:

```
UKZ003                < Transmission Identification >
SS LFIAZSZX
050021 EGQPZSZX
/55325 00000/2320/04 065 0021

/LASSIT
/ENDMSG
```

## 5. RECOMMENDED SIT MESSAGE AFTN PRIORITIES

Table 1 provides the suggested AFTN priorities for the various SIT message types. MCCs may, on a bilateral basis, use different priorities from those suggested.

**Table H.1: Suggested AFTN Priority for SIT Messages**

SIT Number	Type	Suggested Priority	Comments
121	406 INTERFERER NOTIFICATION	DD	
122	406 INCIDENT (NO DOPPLER)	SS	
123	406 POSITION CONFLICT (ENCODED ONLY)	SS	
124	406 AMBIGUITY RESOLUTION (ENCODED ONLY)	SS	
125	406 INCIDENT	SS	
126	406 POSITION CONFLICT	SS	
127	406 AMBIGUITY RESOLUTION	SS	
132	406 NOTIFICATION OF COUNTRY OF REGISTRATION (ENCODED ONLY)	DD / SS	
133	406 NOTIFICATION OF COUNTRY OF REGISTRATION	DD / SS	
185	COSPAS-SARSAT DISTRESS ALERTS TO RCCs/SPOCs	DD / SS	
215	ORBIT VECTORS	DD	
415	SARP CALIBRATION	DD	
510	406 MHz SARR FREQUENCY CALIBRATION OFFSET	DD	
605	SYSTEM STATUS TO ALL MCCs	SS / DD	Operator to decide dependent upon content
915	NARRATIVE MESSAGES FOR MCCs	SS / DD	Operator to decide dependent upon content
925	406 BEACON REGISTRATION INFORMATION	DD / SS

- END OF ANNEX H -

## **ANNEX I**

### **IMPLEMENTATION PLAN FOR NEW COMMUNICATION LINKS**

#### **I.1 IMPLEMENTATION PHASES**

---

##### **I.1.1 Phase I - Internal Development and Testing**

In order to implement a new communication link, each MCC must begin with a phase of internal development and testing. This may require the procurement of communication equipment, specialized hardware, physical connections and/or other communication provider services.

The key purpose of this phase is to ensure that the new communication link is properly installed, configured and coded. Ideally, a capability should be available within the MCC environment to facilitate near “real world” testing. Completion of comprehensive development and testing is essential before proceeding to subsequent phases.

##### **I.1.2 Phase II - Nodal Level Testing and Activation**

Nodal MCCs operate as central entities or “hubs” in the Cospas-Sarsat Network and should be capable of handling any new communication link or protocol. There is limited benefit for an MCC within a DDR to implement a protocol that the nodal MCC does not yet support.

Nodal MCCs can in effect validate the new communication link while also establishing it at the core level of the Cospas-Sarsat System Network. Lessons learned and resulting adjustments made can be passed along to other MCCs to minimize costs resulting from redundant efforts. During this phase each nodal MCC coordinates bilaterally, first testing and then activating each link.

##### **I.1.3 Phase III - DDR Level Testing and Activation**

This phase provides for establishing a new communication protocol between the nodal MCC and each of the MCCs within its DDR. When this phase starts, the nodal MCC will have operational links with most other nodal MCCs, and the experience gained should facilitate efforts under Phase III.

##### **I.1.4 Phase IV - System Wide Testing and Activation**

This phase provides for establishing links between MCCs as well as between MCCs and SPOCs (or RCCs) as appropriate. The intent is to test and activate all links outside the standard nodal configuration, most importantly the connections between additional MCC pairings to support the transmission of Cospas-Sarsat narrative traffic. Communication agreements between neighbouring MCCs shall be addressed during this phase.

## **I.2 IMPLEMENTATION PLAN TO ADDRESS TERMINATION OF X.25**

---

### **I.2.1 Introduction**

Although the details vary for each MCC, the X.25 protocol will no longer be commercially available in many locations beyond 2005. For example, the USMCC anticipates the phase-out of X.25 by 1 September 2005. In order to ensure the reliability and integrity of the Cospas-Sarsat System, it is necessary to address this situation with a specific and complete implementation plan which follows the phases outlined above. The following plan addresses the implementation of AFTN and FTP over Internet VPN (FTPV) by MCCs.

### **I.2.2 Implementation Plan Structure**

Each MCC should have at least two functional communication links, a primary and a backup, for every other MCC with which they must communicate. This implementation plan requires that two links be identified, other than X.25, as the primary and secondary links between the various MCC pairings. Each of the identified protocols must be fully implemented and thoroughly tested according to the schedule defined in the tables provided below.

Implementation schedules in Tables I.1 and I.2 indicate planned dates for nodal level testing and activation of AFTN and FTPV, per Phase II of the implementation plan. Target implementation dates of April 2005 for FTPV and April 2006 for AFTN are observed.

Implementation schedules for activation and testing AFTN and FTPV within each DDR (Phase III) follow in Tables I.3 through I.7. It should be noted that Phase III could begin before Phase II is completed.

**I.2.3 Schedule**

Notes:     FTPV = FTP over Internet VPN  
               AFTN = Aeronautical Fixed Telecommunication Network

**Table I.1: Nodal to Nodal Communications Activation / Verification Check List**

- END OF ANNEX I -

**ANNEX J****PROTOCOL FOR THE TRANSMISSION OF  
SIT MESSAGES VIA ELECTRONIC MAIL (EMAIL)****J.1 EMAIL COMMUNICATIONS**

- J.1.1** Electronic mail is a store-and-forward method of composing, sending, receiving and storing messages over Internet or other networks.
- J.1.2** Email communication should be organized via mail Servers announced by MCCs. Mainly these mail Servers are the ones used for general purpose unformatted communications between MCCs.
- J.1.3** Mail Boxes should be created at Mail Servers exclusively for exchange by SIT information.
- J.1.4** An MCC shall create and send messages with SIT data which would be transmitted via Internet to Mail Box of the receiving MCC. The receiving MCC shall be responsible for disposing the messages received in its Mail Box to the SIT processing programs of MCC.
- J.1.5** Email should be considered as optional means of communication that should be adopted only on a contingency bilateral basis, to be used only during the time required to implement MCC back-up procedures (less than 30 minutes) when both AFTN and FTP-VPN fail.

**J.2 MESSAGE FORMING CONVENTION**

- J.2.1** Each message shall contain exactly one SIT message. The message is formed of the following parts:
1. Receiving MCC Address (To),
  2. Subject field,
  3. Message Body.
- J.2.2** Receiving MCC Address (To) is formed as Recipient-Name@Domain-Name and is received from corresponding MCC on need-to-know basis. Example: [sit-reception-7777@marsat.ru](mailto:sit-reception-7777@marsat.ru),

- J.2.3** Subject field format shall include “?SRCE\_?DEST\_?CUR#.”, where:
- “?SRCE” is the Source MCC Name (per Table II/A.1 at Annex II/A to C/S A.001),
  - “?DEST” is the Destination MCC Name (per Table II/A.1 at Annex II/A to C/S A.001), and
  - “?CUR#” is the Current Message Number (Message Field 1).

The Subject field shall contain only upper case characters. For example, a file with the name “USMCC\_CMCC\_02345” contains Current Message Number 02345 sent by the USMCC to the CMCC.

- J.2.4** Message Body should be created using SIT conventions so only text mode will be used. No attachments should be included in to message.

### **J.3 SECURITY**

- J.3.1** To ensure security of the COSPAS-SARSAT System MCCs using email for SIT messages transmission must be protected by firewall. The computer used for email communications should be protected inside a demilitarized zone (DMZ).

- J.3.2** The messages should be checked by on line antivirus programs.

- J.3.3** The Software Firewall used should be limited to highest level of security

- J.3.4** Message has to be encrypted to prevent corruption.

- J.3.5** Monitoring email communication: MCCs shall monitor the email Client program for abnormal activity periodically checking reception and transmission of messages and sending test messages in cases of absence of messages during given time elapse.(for example, once per hour).

- J.3.6** To avoid loss of messages, a read/receipt confirmation within 15 minutes is recommended.

- END OF ANNEX J -

**ANNEX K****LIST OF ABBREVIATIONS AND ACRONYMS USED IN C/S A.002**

AFTN	Aeronautical Fixed Telecommunication Network
AM	amplitude modulation
AMHS	Aeronautical Message Handling System
AVI	aviation
CCITT	International Telecommunication Union's (ITU) International Telegraph and Telephone Consultative Committee
CI	channel identifier
CID	caller identification
COSPAS	space system for the search of vessels in distress
CR	carriage return
CSC	Cospas-Sarsat Council
CSN	channel sequence number
CTA	cross track angle
CUD	call user data
DD	priority indicator
DTG	date time group
E	east
ELT	emergency locator transmitter
EPIRB	emergency position indicating radio beacon
FTP	file transfer protocol
HEX	hexadecimal
HRS	hours
Hz	hertz
ID	identification
INFO	information
IA5	international alphabet No.5
IP	Internet protocol
IPSec	Internet protocol security
ITA2	international telegraph alphabet No.2
ITC	invitation to clear
JC	Cospas-Sarsat Joint Committee
km	kilometer
LAT	latitude
LF	line feed
LONG	longitude
LOS	loss of signal
LUT	local user terminal

MAR	maritime
MCC	mission control centre
MF	message field
MHz	megahertz (1,000,000 hertz)
MID	maritime identification digits
MIN(S)	minute(s)
mSec	millisecond
MSG	message
mW	milliwatt
N	north
NL	new line
NOCR	notification of country of beacon registration
PAD	packet assembler/disassembler
PLB	personal locator beacon
PROB	probability
PSDN	public switched data network
RCC	rescue co-ordination centre
S	south
SAR	search and rescue
SARP	search and rescue processor
SARR	search and rescue repeater
SARSAT	search and rescue satellite aided tracking
SEC(S)	second(s)
SER	serial
SID	Standard Interface Description
SIT	subject indicator type
SPEC	specification
SPOC	SAR point of contact
SRR	Search and Rescue Region
SS	priority indicator
TCA	time of closest approach
TI	transmission identification
TX	transmitted
USO	ultra-stable oscillator
UTC	co-ordinated universal time
VPN	virtual private network
W	west
X.25	ITU-T specification and protocols for public packet-switched networks
